ACE INHIBITORS, PLAIN

ADRB2 adrenoceptor beta 2, surface

- Clinical Annotations -

· **Class 3** **rs1042713** *GG*

Patients with the GG genotype and heart failure may have increased emergency department visits and hospital utilization when treated with cardiovascular drugs as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence efficacy of cardiovascular drugs.

ADRB1 adrenoceptor beta 1

- Clinical Annotations -

· **Class 3** **rs1801253** *GG*

Patients with the CC genotype and heart failure may have increased emergency department utilization when treated with cardiovascular drugs as compared to patients with the GG genotype. Other genetic and clinical factors may also influence efficacy of cardiovascular drugs.

ANALGESICS

COMT catechol-O-methyltransferase

- Clinical Annotations -

· **Class 3** **rs4680** *GA*

Patients with the AG genotype with substance withdrawal syndrome may have an increased likelihood of headache when discontinuing the use of analgesics (such as opioids, NSAIDs, triptans, ergot) as compared to patients with the AA genotype. Other clinical and genetic factors may also influence likelihood of headache in patients with withdrawal syndrome who discontinue the use of analgesics.

ANTIINFLAMMATORY AGENTS, NON-STEROIDS

COMT catechol-O-methyltransferase

- Clinical Annotations -

· **Class 3** **rs4680** *GA*

Patients with the AG genotype with substance withdrawal syndrome may have an increased likelihood of headache when discontinuing the use of analgesics (such as opioids, NSAIDs, triptans, ergot) as compared to patients with the AA genotype. Other clinical and genetic factors may also influence likelihood of headache in patients with withdrawal syndrome who discontinue the use of analgesics.

ANTIVIRALS FOR TREATMENT OF HIV INFECTIONS, COMBINATIONS

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*

Patients with the GG genotype who are co-infected with HIV and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-tubercular and antiretroviral drugs as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of hepatotoxicity.

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations

· **Class 3** **rs3745274** *GG*

Patients with the GG genotype who are co-infected with HIV and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-tubercular and antiretroviral drugs as compared to patients with the TT genotype. Other genetic and clinical factors may also influence risk of hepatotoxicity.

CYP2A7P1 cytochrome P450, family 2, subfamily A, polypeptide 7 pseudogene 1

- Clinical Annotations

· **Class 3** **rs3745274** *GG*

Patients with the GG genotype who are co-infected with HIV and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-tubercular and antiretroviral drugs as compared to patients with the TT genotype. Other genetic and clinical factors may also influence risk of hepatotoxicity.

BETA BLOCKING AGENTS

ADRB2 adrenoceptor beta 2, surface

- Clinical Annotations

· **Class 3** **rs1042713** *GG*

Patients with the GG genotype and heart failure may have increased emergency department visits and hospital utilization when treated with cardiovascular drugs as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence efficacy of cardiovascular drugs.

ADRB1 adrenoceptor beta 1

- Clinical Annotations

· **Class 3** **rs1801253** *GG*

Patients with the CC genotype and heart failure may have increased emergency department utilization when treated with cardiovascular drugs as compared to patients with the GG genotype. Other genetic and clinical factors may also influence efficacy of cardiovascular drugs.

DABIGATRAN

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 4** **rs1045642** *GG*
  People with the GG genotype may have decreased exposure to dabigatran compared to patients with the AA and AG genotypes, when also assessed with the rs2032582 allele. Other clinical and genetic factors may affect exposure to dabigatran.
- **Class 4** **rs2032582** *CC*
  People with the CC genotype may have decreased exposure to dabigatran compared to patients with a variant at this position, including genotypes AA, AC, CT, and TT, when assessed in conjunction with a variant at position rs1045642. Other clinical and genetic factors may affect exposure to dabigatran.

DRUGS FOR TREATMENT OF TUBERCULOSIS

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-TB drugs as compared to patients with the AA genotype. Other genetic and clinical factors may also influence hepatotoxicity.
- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype who are co-infected with HIV and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-tubercular and antiretroviral drugs as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of hepatotoxicity.

CYP2E1 cytochrome P450, family 2, subfamily E, polypeptide 1

- Clinical Annotations

- **Class 3** **rs2031920** *CC*
  Patients with the CC genotype and tuberculosis (TB) may have an increased risk for hepatotoxicity when treated with anti-TB drugs as compared to patients with the CT or TT genotype. However, the majority of studies find no association with hepatotoxicity. Other genetic and clinical factors, such as variations in the NAT2 gene, may also influence risk for hepatotoxicity.

DUX1 double homeobox 1

- Clinical Annotations

· **Class 3** **rs2031920** *CC*

Patients with the CC genotype and tuberculosis (TB) may have an increased risk for hepatotoxicity when treated with anti-TB drugs as compared to patients with the CT or TT genotype. However, the majority of studies find no association with hepatotoxicity. Other genetic and clinical factors, such as variations in the NAT2 gene, may also influence risk for hepatotoxicity.

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations

· **Class 3** **rs3745274** *GG*

Patients with the GG genotype who are co-infected with HIV and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-tubercular and antiretroviral drugs as compared to patients with the TT genotype. Other genetic and clinical factors may also influence risk of hepatotoxicity.

CYP2A7P1 cytochrome P450, family 2, subfamily A, polypeptide 7 pseudogene 1

- Clinical Annotations

· **Class 3** **rs3745274** *GG*

Patients with the GG genotype who are co-infected with HIV and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-tubercular and antiretroviral drugs as compared to patients with the TT genotype. Other genetic and clinical factors may also influence risk of hepatotoxicity.

NAT2 N-acetyltransferase 2 (arylamine N-acetyltransferase)

- Clinical Annotations

· **Class 3** **rs1799929** *CC*

Patients with the CC genotype and tuberculosis (TB) may have a decreased risk for hepatotoxicity when treated with anti-TB drugs as compared to patients with the CT or TT genotype. This SNP is present in a variety of NAT2 * alleles resulting in different NAT2 acetylator phenotypes, and is the signature SNP of NAT2*11. Other genetic and clinical factors may also influence hepatotoxicity.

OPIUM ALKALOIDS AND DERIVATIVES

CHRNA3 cholinergic receptor, nicotinic, alpha 3 (neuronal)

- Clinical Annotations

· **Class 3** **rs16969968** *GG*

Patients with the GG genotype who are in chronic pain and receive opioid medications for treatment may be at decreased risk for addiction as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of opiate addiction.

CHRNA5 cholinergic receptor, nicotinic, alpha 5 (neuronal)

- Clinical Annotations -

· **Class 3** **rs16969968** *GG*

Patients with the GG genotype who are in chronic pain and receive opioid medications for treatment may be at decreased risk for addiction as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of opiate addiction.

PLATINUM COMPOUNDS

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations -

· **Class 3** **rs1045642** *GG*

Patients with the GG genotype and non-small-cell lung cancer may have a better response to platinum-based chemotherapy as compared to patients with the AA or AG genotype. This was only seen in those of Asian ethnicity. Other genetic and clinical factors may also influence response to platinum-based chemotherapy.

· **Class 3** **rs1128503** *GG*

Patients with the GG genotype and non-small cell lung cancer may have reduced risk of toxicities when treated with platinum-based chemotherapy compared to patients with the AA genotype. Other clinical and genetic factors may affect risk of toxicities in response to platinum-based chemotherapies.

PYRIMIDINE ANALOGUES

DPYD dihydropyrimidine dehydrogenase

- Clinical Annotations -

· **Class 1A** **rs55886062** *AA*

Patients with the AA genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have a decreased, but not absent, risk for drug toxicity as compared to patients with the AC or CC genotype (DPYD *1/*13 or *13/*13). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

· **Class 1A** **rs3918290** *CC*

Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of fluoropyrimidine drugs and 2) decreased, but not non-existent, risk for drug toxicity as compared to patients with the CT or TT genotype (DPYD *1/*2A or *2A/*2A). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine based chemotherapy.

- **Class 1A** **rs67376798** *TT*

  Patients with the TT genotype and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of the drug and 2) decreased, but not absent, risk and reduced severity of drug toxicity as compared to patients with the AT genotype. Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801159** *TT*

  Patients with the TT genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) a decreased likelihood of nausea, vomiting, and leukopenia, 2) increased response and 3) increased clearance of fluorouracil as compared to patients with the CT or CC genotype (DPYD *1/*5 or *5/*5). However, other studies find no associations or contradictory associations with fluoropyrimidine-induced drug toxicity or response. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

ACENOCOUMAROL

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

- Clinical Annotations -

- **Class 2A** **rs1057910** *AC*

  Patients with the AC genotype may require decreased dose of acenocoumarol or closer INR monitoring as compared to patients with the AA genotype. Other genetic and clinical factors may also influence acenocoumarol dose.

- **Class 3** **rs1799853** *CC*

  Patients with the CC genotype who are taking acenocoumarol may have a decreased risk of a gastrointestinal hemorrhage as compared to patients with the CT or TT genotype. Other genetic and clinical factors may also influence risk of gastrointestinal hemorrhage.

VKORC1 vitamin K epoxide reductase complex, subunit 1

- Clinical Annotations -

- **Class 2A** **rs9934438** *GA*

  Patients with the AG genotype may have decreased dose of acenocoumarol or phenprocoumon as compared to patients with genotype GG. Other genetic and clinical factors may also influence the dose of acenocoumarol or phenprocoumon.

PRSS53 protease, serine, 53

- Clinical Annotations -

- **Class 2A** **rs9934438** *GA*

  Patients with the AG genotype may have decreased dose of acenocoumarol or phenprocoumon as compared to patients with genotype GG. Other genetic and clinical factors may also influence the dose of acenocoumarol or phenprocoumon.

UGT1A UDP glucuronosyltransferase 1 family, polypeptide A complex locus

- Clinical Annotations

· **Class 3** **rs8330** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

· **Class 3** **rs1042640** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

· **Class 3** **rs10929303** *TC*
Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

· **Class 3** **rs8330** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

· **Class 3** **rs1042640** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

· **Class 3** **rs10929303** *TC*
Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A3 UDP glucuronosyltransferase 1 family, polypeptide A3

- Clinical Annotations

· **Class 3** **rs8330** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

· **Class 3** **rs1042640** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

· **Class 3** **rs10929303** *TC*

Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

- **Class 3** **rs8330** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.
- **Class 3** **rs1042640** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.
- **Class 3** **rs10929303** *TC*
Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A5 UDP glucuronosyltransferase 1 family, polypeptide A5

- Clinical Annotations

- **Class 3** **rs8330** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.
- **Class 3** **rs1042640** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.
- **Class 3** **rs10929303** *TC*
Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

- Clinical Annotations

- **Class 3** **rs8330** *GC*
Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.
- **Class 3** **rs1042640** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A7 UDP glucuronosyltransferase 1 family, polypeptide A7

Clinical Annotations

- **Class 3** **rs8330** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

Clinical Annotations

- **Class 3** **rs8330** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

Clinical Annotations

- **Class 3** **rs8330** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

UGT1A1 UDP glucuronosyltransferase 1 family, polypeptide A1

- Clinical Annotations

- **Class 3** **rs8330** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype may have a decreased risk of liver failure due to unintentional acetaminophen overdose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of liver failure due to unintentional acetaminophen overdose.

AMLODIPINE

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

- **Class 3** **rs2740574** *TT*

Women with the TT genotype and hypertension may have an increased likelihood of reaching a target mean arterial pressure of ¡= 107 mm Hg when treated with amlodipine as compared to women with the CC genotype. No significant associations were seen when considering a target mean arterial pressure of ¡= 92 mm Hg, or when considering men or men and women together. Other genetic and clinical factors may also influence response to amlodipine.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

- **Class 3** **rs2740574** *TT*

Women with the TT genotype and hypertension may have an increased likelihood of reaching a target mean arterial pressure of ¡= 107 mm Hg when treated with amlodipine as compared to women with the CC genotype. No significant associations were seen when considering a target mean arterial pressure of ¡= 92 mm Hg, or when considering men or men and women together. Other genetic and clinical factors may also influence response to amlodipine.

- **Class 3** **rs776746** *CC*

Healthy males with the CC (CYP3A5 *3/*3) genotype may have increased metabolism of amlodipine as compared to healthy males with the CT or TT (*3/*1 or *1/*1) genotype. No significant associations were seen when considering clearance of amlodipine. Other genetic and clinical factors may also influence metabolism of amlodipine.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations

- **Class 3** **rs776746** *CC*

Healthy males with the CC (CYP3A5 *3/*3) genotype may have increased metabolism of amlodipine as compared to healthy males with the CT or TT (*3/*1 or *1/*1) genotype. No significant associations were seen when considering clearance of amlodipine. Other genetic and clinical factors may also influence metabolism of amlodipine.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

- **Class 3** **rs776746** *CC*

Healthy males with the CC (CYP3A5 *3/*3) genotype may have increased metabolism of amlodipine as compared to healthy males with the CT or TT (*3/*1 or *1/*1) genotype. No significant associations were seen when considering clearance of amlodipine. Other genetic and clinical factors may also influence metabolism of amlodipine.

ANASTROZOLE

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 4** **rs3732219** *CC*

Patients with the CC genotype may have increased glucuronidation of anastrozole as compared to patients with the CT or TT genotype, as determined by in vitro assays. Glucuronidation allows for the elimination of xenobiotics like anastrozole. Other genetic and clinical factors may also influence glucuronidation of anastrozole.

- **Class 4** **rs3732218** *GG*

Patients with the GG genotype may have increased glucuronidation of anastrozole as compared to patients with the AA or AG genotype, as determined by in vitro assays. Glucuronidation allows for the elimination of xenobiotics like anastrozole. Other genetic and clinical factors may also influence glucuronidation of anastrozole.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

- **Class 4** **rs3732219** *CC*

Patients with the CC genotype may have increased glucuronidation of anastrozole as compared to patients with the CT or TT genotype, as determined by in vitro assays. Glucuronidation allows for the elimination of xenobiotics like anastrozole. Other genetic and clinical factors may also influence glucuronidation of anastrozole.

- **Class 4** **rs3732218** *GG*

ANTHRACYCLINES AND RELATED SUBSTANCES

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype may have 1) decreased exposure to doxorubicin metabolites and 2) decreased response to anthracycline regimens as compared to patients with the AA genotype, however the evidence is highly contradictory. Other genetic and clinical factors may also influence response to anthracycline regimens.

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 3** **rs6759892** *TG*

Patients with the GT genotype may have increased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype TT and decreased likelihood as compared to patients with the GG genotype, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

- **Class 3** **rs17863783** *GG*

Patients with the GG genotype may have decreased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype GT or TT, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

- Clinical Annotations

- **Class 3** **rs6759892** *TG*

Patients with the GT genotype may have increased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype TT and decreased likelihood as compared to patients with the GG genotype, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

- **Class 3** **rs17863783** *GG*

Patients with the GG genotype may have decreased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype GT or TT, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

UGT1A7 UDP glucuronosyltransferase 1 family, polypeptide A7

- Clinical Annotations

- **Class 3** **rs6759892** *TG*

Patients with the GT genotype may have increased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype TT and decreased likelihood as compared to patients with the GG genotype, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

- **Class 3** **rs6759892** *TG*

Patients with the GT genotype may have increased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype TT and decreased likelihood as compared to patients with the GG genotype, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

- **Class 3** **rs17863783** *GG*

Patients with the GG genotype may have decreased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype GT or TT, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations

- **Class 3** **rs6759892** *TG*

Patients with the GT genotype may have increased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype TT and decreased likelihood as compared to patients with the GG genotype, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

- **Class 3** **rs17863783** *GG*

Patients with the GG genotype may have decreased likelihood of cardiotoxicity when exposed to anthracyclines and related substances in children with Neoplasms as compared to patients with genotype GT or TT, although this has been contradicted in one study. Other genetic and clinical factors may also influence the risk of toxicity to anthracyclines and related substances.

ANTIEPILEPTICS

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1128503** *GG*

Patients with the GG genotype and specifically localization-related epilepsy syndrome may have a decreased risk for resistance to antiepileptic treatment as compared to patients with the AA genotype. However, all other studies of people with epilepsy have found no association between this variant and antiepileptic resistance. Other genetic and clinical factors may also influence resistance to antiepileptics.

SCN1A sodium channel, voltage-gated, type I, alpha subunit

- Clinical Annotations -

- **Class 2B** **rs3812718** *CT*

Patients with the CT genotype and epilepsy may be less likely to be resistant to antiepileptic treatment, particularly carbamazepine, as compared to patients with the TT genotype. Other genetic and clinical factors may also influence resistance to antiepileptic drugs.

ANTIPSYCHOTICS

COMT catechol-O-methyltransferase

- Clinical Annotations -

- **Class 3** **rs4680** *GA*

Patients with the AG genotype may have increased blood pressure when treated with antipsychotics as compared to patients with the GG genotype. Other genetic and clinical factors may also influence blood pressure in patients receiving antipsychotics.

- **Class 3** **rs4680** *GA*

Patients with the AG genotype may have increased fasting glucose levels when treated with antipsychotics as compared to patients with the GG genotype. Other genetic and clinical factors may also influence fasting glucose in patients taking antipsychotics.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations -

- **Class 3** **rs2032582** *CC*

Patients with the CC genotype and schizophrenia who responded to treatment with antipsychotics may require an increased dose of antipsychotics as compared to patients with the AA genotype. Other genetic and clinical factors may also influence dose of antipsychotics.

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype and schizophrenia who responded to treatment with antipsychotics may require an increased dose of antipsychotics as compared to patients with the AA genotype. Other genetic and clinical factors may also influence dose of antipsychotics.

ATAZANAVIR

UGT1A UDP glucuronosyltransferase 1 family, polypeptide A complex locus

- Clinical Annotations -

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the TT genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs1042640** *GC*

  Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to patients with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in people with HIV who are taking atazanavir and ritonavir.
- **Class 3** **rs8330** *GC*

  Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype and HIV may have increased concentrations of atazanavir as compared to patients with the AA genotypes, although this is contradicted in one study. There is no evidence that the GG genotype is associated with hyperbilirubinemia, drug discontinuation, or nephrolithiasis. Other clinical and genetic factors may also influence the concentrations of atazanavir in patients with HIV.

ATENOLOL

ADRB2 adrenoceptor beta 2, surface

- Clinical Annotations -

· **Class 3** **rs1042714** *GG*

Patients with the GG genotype and hypertension may have an increased risk of developing hypertriglyceridemia when treated with atenolol or metoprolol as compared to patients with the CC or CG genotype. Other genetic and clinical factors may also influence risk of hypertriglyceridemia.

ATORVASTATIN

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations -

· **Class 3** **rs717620** *CT*

Patients with the CT genotype may have decreased dose of simvastatin and atorvastatin as compared to patients with genotype CC. Other genetic and clinical factors may also influence the dose of simvastatin.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations -

· **Class 3** **rs2740574** *TT*

Patients with the TT genotype may be more likely to require a decrease in dose or switch to a different drug when treated with atorvastatin or simvastatin as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence dose of simvastatin or atorvastatin, or likelihood of switching to a different drug.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations -

· **Class 3** **rs2740574** *TT*

Patients with the TT genotype may be more likely to require a decrease in dose or switch to a different drug when treated with atorvastatin or simvastatin as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence dose of simvastatin or atorvastatin, or likelihood of switching to a different drug.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations -

· **Class 3** **rs2032582** *CC*

Patients with the CC genotype may have increased risk of drug-induced liver injury compared to patients with the TT genotype. Other factors may affect liver toxicity when treated with atorvastatin.

BENAZEPRIL

ADRB2 adrenoceptor beta 2, surface

- Clinical Annotations -

- **Class 3** **rs1042713** *GG*

Patients with the GG genotype and hypertension may have a greater decrease in diastolic blood pressure when treated with benazepril as compared to patients with the AA genotype. No significant results have been seen for systolic blood pressure. Additionally, the same study reported no significant differences in systolic or diastolic blood pressure between genotypes in a different cohort. Other genetic and clinical factors may also influence change in diastolic or systolic blood pressure.

BEVACIZUMAB

VEGFA vascular endothelial growth factor A

- Clinical Annotations -

- **Class 3** **rs2010963** *CG*

Patients with the CG genotype and choroidal neovascularization may have a better response to anti-VEGF treatment, as compared to patients with the CC genotype. Other genetic and clinical factors may also influence response to anti-VEGF treatment.

- **Class 3** **rs699947** *AC*

Patients with colorectal cancer and the AC genotype may have a reduced response to bevacizumab, capecitabine, fluorouracil, irinotecan, leucovorin, or oxaliplatin as compared to patients with the CC genotype. Other clinical and genetic factors may also affect response to chemotherapy in people with colorectal cancer.

BUPROPION

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations -

- **Class 3** **rs3211371** *CC*

Patients with the CC genotype who are smokers may have a lower chance of smoking cessation when treated with bupropion as compared to patients with the CT or TT genotype, although this is contradicted in one study. Other genetic and clinical factors may also influence likelihood of smoking cessation.

- **Class 3** **rs2279343** *AA*

Individuals with tobacco use disorder and the AA genotype may have an improved response to bupropion as compared to individuals with the AG and GG genotypes. Other clinical and genetic factors may also affect response to bupropion in individuals with tobacco use disorder.

BUSULFAN

CYP2C19 cytochrome P450, family 2, subfamily C, polypeptide 19

- Clinical Annotations

· **Class 3** **rs12248560** *CC*
Patients with the CC genotype (CYP2C19 *1/*1) undergoing transplantation may have decreased metabolism of busulfan as compared to patients with the CT (*1/*17) or TT (*17/*17) genotype. However, some contradictory evidence exists for this association. Other genetic and clinical factors may also influence metabolism of busulfan.

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

- Clinical Annotations

· **Class 3** **rs1799853** *CC*
Patients with the CC (CYP2C9 *1/*1) genotype undergoing hemopoietic stem cell transplant may have increased metabolism of busulfan as compared to patients with the CT (*1/*2) or TT (*2/*2) genotype. Other genetic and clinical factors may also influence metabolism of busulfan.

CAPECITABINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*
Patients with GG genotype may have increased risk of hand-foot syndrome when treated with capecitabine in people with Colorectal Neoplasms as compared to patients with genotype AA. Genotypes AG + GG are not associated with decreased clinical outcome when treated with capecitabine, cisplatin, docetaxel, epirubicin and gemcitabine in people with Pancreatic Neoplasms as compared to genotype AA. Other genetic and clinical factors may influence the response to capecitabine.

· **Class 3** **rs2032582** *CC*
Patients with genotype CC may have increased risk of hand-foot syndrome when treated with capecitabine in people with Colorectal Neoplasms as compared to patients with genotype AA. Other genetic and clinical factors may also influence the response to capecitabine.

· **Class 3** **rs1128503** *GG*
Patients with the GG genotype and colorectal cancer may have an increased risk of neutropenia or hand-foot syndrome when treated with capecitabine as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of neutropenia or hand-foot syndrome.

CDA cytidine deaminase

- Clinical Annotations

· **Class 3** **rs602950** *AA*
Cancer patients with the AA genotype may have a decreased risk of diarrhea or dehydration when treated with capecitabine-based therapy as compared to patients with the AG or GG genotype. Other genetic and clinical factors may also influence risk of diarrhea and dehydration.

DPYD dihydropyrimidine dehydrogenase

Dosing Guideline

DPYD:*1/*1 Moderate

Use label-recommended dosage and administration.

Clinical Annotations

- **Class 1A** **rs55886062** *AA*

Patients with the AA genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have a decreased, but not absent, risk for drug toxicity as compared to patients with the AC or CC genotype (DPYD *1/*13 or *13/*13). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 1A** **rs3918290** *CC*

Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of fluoropyrimidine drugs and 2) decreased, but not non-existent, risk for drug toxicity as compared to patients with the CT or TT genotype (DPYD *1/*2A or *2A/*2A). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine based chemotherapy.

- **Class 1A** **rs67376798** *TT*

Patients with the TT genotype and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of the drug and 2) decreased, but not absent, risk and reduced severity of drug toxicity as compared to patients with the AT genotype. Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801160** *CC*

Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased metabolism of fluorouracil and 2) decreased risk for drug toxicities as compared to patients with the CT or TT genotype (DPYD *1/*6 or *6/*6). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin) or with other drugs such as bevacizumab, cetuximab, raltitrexed. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801159** *TT*

Patients with the TT genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) a decreased likelihood of nausea, vomiting, and leukopenia, 2) increased response and 3) increased clearance of fluorouracil as compared to patients with the CT or CC genotype (DPYD *1/*5 or *5/*5). However, other studies find no associations or contradictory associations with fluoropyrimidine-induced drug toxicity or response. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801158** *CC*

Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) a decreased but not absent risk of toxicity and 2) increased DPYD activity as compared to patients with the CT genotype (DPYD *1/*4). However, some studies find no association with drug toxicity or DPYD activity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

VEGFA vascular endothelial growth factor A

- Clinical Annotations

- **Class 3** **rs699947** *AC*

Patients with colorectal cancer and the AC genotype may have a reduced response to bevacizumab, capecitabine, fluorouracil, irinotecan, leucovorin, or oxaliplatin as compared to patients with the CC genotype. Other clinical and genetic factors may also affect response to chemotherapy in people with colorectal cancer.

- **Class 3** **rs2010963** *CG*

Patients with the CG genotype and colorectal cancer may have a poorer response when treated with capecitabine and oxaliplatin (XELOX) as compared to patients with the CC or GG genotype. Other genetic and clinical factors may also influence response to XELOX treatment.

CARBAMAZEPINE

SCN1A sodium channel, voltage-gated, type I, alpha subunit

- Clinical Annotations

- **Class 2B** **rs3812718** *CT*

Patients with the CT genotype who are treated with carbamazepine may require a higher dose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence dose of carbamazepine.

- **Class 2B** **rs3812718** *CT*

Patients with the CT genotype and epilepsy may be less likely to be resistant to antiepileptic treatment, particularly carbamazepine, as compared to patients with the TT genotype. Other genetic and clinical factors may also influence resistance to antiepileptic drugs.

- **Class 3** **rs3812718** *CT*

Patients with epilepsy and the CT genotype may have decreased metabolism of carbamazepine, resulting in increased exposure as compared to patients with the TT genotype.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*

Patient with genotype GG may have decreased likelihood of drug resistance when treated with antiepileptics and carbamazepine in people with Epilepsy as compared to patients with genotype AA. However, contradictory findings have been reported. Other genetic and clinical factors may also influence response to carbamazepine.

- **Class 3** **rs1128503** *GG*

African American and white patients with the GG genotype and epilepsy may have decreased clearance of carbamazepine as compared to patients with the AA or AG genotype. This association was not found in Chinese patients. Other genetic and clinical factors may also influence clearance of carbamazepine.

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype and epilepsy may have decreased metabolism of carbamazepine and may need a decreased dose as compared to patients with the AG genotype. However, multiple studies have shown no association with dose or concentrations of carbamazepine. Other genetic and clinical factors may also influence concentrations of carbamazepine.

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations

- **Class 3** **rs3740066** *CT*

Patients with the CT genotype may have decreased metabolism of carbamazepine in men with Epilepsy as compared to patients with genotype CC. This association was only significant in male patients. Other genetic and clinical factors may also influence the metabolism of carbamazepine.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) and epilepsy may have decreased clearance and increased concentrations of carbamazepine, and require lower doses of the drug, as compared to patients with the CT (*1/*3) or TT (*1/*1) genotype. Other genetic and clinical factors may also influence dose or concentrations of carbamazepine.

- **Class 3** **rs15524** *AA*

Patients with the AA genotype and epilepsy may have increased concentrations of carbamazepine compared to patients with the AG and GG genotypes when patients were also taking phenytoin or phenobarbital. Other clinical and genetic factors may affect concentrations of carbamazepine.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) and epilepsy may have decreased clearance and increased concentrations of carbamazepine, and require lower doses of the drug, as compared to patients with the CT (*1/*3) or TT (*1/*1) genotype. Other genetic and clinical factors may also influence dose or concentrations of carbamazepine.

- **Class 3** **rs15524** *AA*

Patients with the AA genotype and epilepsy may have increased concentrations of carbamazepine compared to patients with the AG and GG genotypes when patients were also taking phenytoin or phenobarbital. Other clinical and genetic factors may affect concentrations of carbamazepine.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

- **Class 3** **rs776746** *CC*
  Patients with the CC genotype (CYP3A5 *3/*3) and epilepsy may have decreased clearance and increased concentrations of carbamazepine, and require lower doses of the drug, as compared to patients with the CT (*1/*3) or TT (*1/*1) genotype. Other genetic and clinical factors may also influence dose or concentrations of carbamazepine.
- **Class 3** **rs2740574** *TT*
  Patients with the TT genotype and epilepsy may have increased clearance of carbamazepine as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence clearance of carbamazepine.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

- **Class 3** **rs2242480** *CC*
  Patients with the CC genotype (CYP3A4 *1/*1) and epilepsy may have increased concentrations of carbamazepine as compared to patients with the CT (*1/*1G) or TT (*1G/*1G) genotype. However, studies conflict. Other genetic and clinical factors may also influence concentrations of carbamazepine.
- **Class 3** **rs2740574** *TT*
  Patients with the TT genotype and epilepsy may have increased clearance of carbamazepine as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence clearance of carbamazepine.

CYP1A2 cytochrome P450, family 1, subfamily A, polypeptide 2

- Clinical Annotations

- **Class 3** **rs762551** *AA*
  Pediatric patients with epilepsy and the AA genotype may have increased clearance of carbamazepine as compared to pediatric patients with epilepsy and the AC or CC genotypes. Other clinical and genetic factors may also influence clearance of carbamazepine in pediatric patients with epilepsy.

CARVEDILOL

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 3** **rs4148323** *GG*
  Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A3 UDP glucuronosyltransferase 1 family, polypeptide A3

- Clinical Annotations

· **Class 3** **rs4148323** *GG*
Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

· **Class 3** **rs4148323** *GG*
Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A5 UDP glucuronosyltransferase 1 family, polypeptide A5

- Clinical Annotations

· **Class 3** **rs4148323** *GG*
Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

- Clinical Annotations

· **Class 3** **rs4148323** *GG*
Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A7 UDP glucuronosyltransferase 1 family, polypeptide A7

- Clinical Annotations

· **Class 3** **rs4148323** *GG*
Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for

their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

· **Class 3** **rs4148323** *GG*

Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations

· **Class 3** **rs4148323** *GG*

Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

UGT1A1 UDP glucuronosyltransferase 1 family, polypeptide A1

- Clinical Annotations

· **Class 3** **rs4148323** *GG*

Patients with the GG (i.e. UGT1A1 *1/*1) genotype and angina or heart failure may have increased glucuronidation of carvedilol as compared to patients with the AA (*6/*6) genotype. UGT1A1 is responsible for the glucuronidation of target substrates, rendering them water soluble and allowing for their biliary or renal elimination. Other genetic and clinical factors may also influence metabolism of carvedilol.

CATECHOLAMINES

ADRB1 adrenoceptor beta 1

- Clinical Annotations

· **Class 3** **rs1801253** *GG*

Patients with the GG genotype and coronary artery disease may require an increased dose of catecholamines as compared to patients with the CC or CG genotype. Other genetic and clinical factors may also influence required dose of catecholamines.

CELECOXIB

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

- Clinical Annotations

· **Class 2A** **rs1057910** *AC*
Patients with the AC (CYP2C9 *1/*3) genotype may have reduced metabolism of celecoxib as compared to patients with the AA (*1/*1) genotype, and increased metabolism as compared to patients with the CC (*3/*3) genotype. Other genetic and clinical factors may also influence metabolism of celecoxib.

CLOPIDOGREL

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*
People with GG genotype may have decreased, but not absent, risk of major adverse cardiovascular events (MACE such as cardiovascular death, myocardial infarction, or stroke) when treated with clopidogrel in people with acute coronary syndrome or myocardial Infarction as compared to people with genotypes AA. Contradictory findings have been reported in the literature. Other genetic and clinical factors may also impact the response to clopidogrel.

MED12L mediator complex subunit 12-like

- Clinical Annotations

· **Class 3** **rs2046934** *AA*
Patients with the AA genotype may have increased risk of adverse cardiac events when treated with clopidogrel as compared to patients with genotype GG. Other genetic and clinical factors may also influence the response to clopidogrel.

P2RY12 purinergic receptor P2Y, G-protein coupled, 12

- Clinical Annotations

· **Class 3** **rs2046934** *AA*
Patients with the AA genotype may have increased risk of adverse cardiac events when treated with clopidogrel as compared to patients with genotype GG. Other genetic and clinical factors may also influence the response to clopidogrel.

CLOZAPINE

COMT catechol-O-methyltransferase

- Clinical Annotations

· **Class 3** **rs4680** *GA*

Patients with the AG genotype and schizophrenia may have a poorer response when treated with clozapine as compared to patients with the GG genotype. Other genetic and clinical factors may also influence response to clozapine.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*
Patients with the GG genotype may have decreased clozapine plasma concentrations, as well as a decreased risk for clozapine-induced agranulocytosis or neutropenia, as compared to patients with the AA genotype. Other genetic and clinical factors may also influence concentrations and risk of clozapine-induced toxicity.

CODEINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1128503** *GG*
Breast-feeding infants whose mothers have the GG genotype and are taking codeine may be at decreased risk for CNS depression as compared to those whose mothers have the AA genotype. Other genetic and clinical factors may also influence the risk of CNS depression in breast-feeding infants.

COTININE

CHRNA3 cholinergic receptor, nicotinic, alpha 3 (neuronal)

- Clinical Annotations

· **Class 3** **rs16969968** *GG*
Individuals with Tobacco Use Disorder and the GG genotype may have decreased concentrations of cotinine, a metabolite of nicotine, as compared to individuals with the AG or AA genotype. Other clinical and genetic factors may also contribute to cotinine concentrations in individuals with Tobacco Use Disorder.

CHRNA5 cholinergic receptor, nicotinic, alpha 5 (neuronal)

- Clinical Annotations

· **Class 3** **rs16969968** *GG*
Individuals with Tobacco Use Disorder and the GG genotype may have decreased concentrations of cotinine, a metabolite of nicotine, as compared to individuals with the AG or AA genotype. Other clinical and genetic factors may also contribute to cotinine concentrations in individuals with Tobacco Use Disorder.

COUMARIN

CYP2A6 cytochrome P450, family 2, subfamily A, polypeptide 6

Clinical Annotations

- **Class 4** **rs1801272** *AT*
  Patients with the AT genotype may have increased 7-hydroxylation of coumarin compared to patients with the TT genotype. Other genetic and clinical factors may also influence metabolism of coumarin.

CYCLOPHOSPHAMIDE

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

Clinical Annotations

- **Class 3** **rs2740574** *TT*
  Premenopausal patients with the TT genotype and breast cancer who are treated with cyclophosphamide may have a shorter period of time before chemotherapy-induced ovarian failure compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence time to chemotherapy-induced ovarian failure.

CYP3A cytochrome P450, family 3, subfamily A

Clinical Annotations

- **Class 3** **rs2740574** *TT*
  Premenopausal patients with the TT genotype and breast cancer who are treated with cyclophosphamide may have a shorter period of time before chemotherapy-induced ovarian failure compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence time to chemotherapy-induced ovarian failure.

VEGFA vascular endothelial growth factor A

Clinical Annotations

- **Class 3** **rs2010963** *CG*
  Patients with the CG genotype and prostate cancer may have longer progression-free survival time when treated with cyclophosphamide as compared to patients with the CC genotype. Other genetic and clinical factors may also influence length of progression-free survival.
- **Class 3** **rs1570360** *AG*
  Patients with the AG genotype and prostate cancer may have longer progression-free survival time when treated with docetaxel plus oral metronomic cyclophosphamide as compared to patients with the AA genotype. Other genetic and clinical factors may also influence progression-free survival time.

CYP1B1 cytochrome P450, family 1, subfamily B, polypeptide 1

Clinical Annotations

- **Class 3** **rs1056836** *GG*
  Patients with the GG genotype and breast cancer may have a better response when treated with cyclophosphamide, epirubicin and fluorouracil as compared to patients with the CC genotype. Other genetic and clinical factors may also influence response to treatment with cyclophosphamide, epirubicin and fluorouracil. (Note: with a C/G variant, particularly in a gene on the minus chromosomal strand, and frequencies close to 50

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations

- **Class 3** **rs4802101** *TT*
  Patients with the TT genotype may have increased metabolism of cyclophosphamide, resulting in increased concentrations of active cyclophosphamide metabolites, and increased risk of gastrointestinal toxicity, or leukopenia, as compared to patients with the CT or CC genotypes. Other clinical and genetic factors may also influence metabolism of cyclophosphamide, as well as risk of toxicity in patients with lupus.

CYCLOSPORINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1128503** *GG*
  Patients with the GG genotype and myasthenia gravis or organ transplantation may have increased clearance of cyclosporine and therefore may require an increased dose of cyclosporine, compared to patients with the AA genotype. Patients with the GG genotype may also have a decreased risk of infection as compared to those with the AA or AG genotype. Other genetic and clinical factors may also influence clearance and dose of cyclosporine.
- **Class 3** **rs2032582** *CC*
  Patients with the CC genotype may have lower blood trough concentrations of cyclosporine compared to patients with the AA genotype, and may require dose adjustments. Other genetic and clinical factors may also influence cyclosporine blood concentrations.
- **Class 3** **rs1045642** *GG*
  Patients with genotype GG may have decreased intracellular and blood concentrations of cyclosporine in people with Transplantation as compared to patients with genotype AA or AG. However, contradictory findings have been reported. Other genetic and clinical factors may also influence the concentration of cyclosporine.
- **Class 3** **rs2032582** *CC*
  Patients with the CC genotype and cystic fibrosis may have increased clearance of dicloxacillin, when it is coadministered with cyclosporine, as compared to patients with the AA genotype. Other genetic and clinical factors may also influence clearance of dicloxacillin.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations

- **Class 2B** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) may require a lower dose of cyclosporine to reach target blood concentration as compared to patients with the CT (CYP3A5 *1/*3) or TT (CYP3A5 *1/*1) genotype, although this is contradicted in some studies. Other genetic and clinical factors may also influence dose of cyclosporine.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

- Class 2B **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) may require a lower dose of cyclosporine to reach target blood concentration as compared to patients with the CT (CYP3A5 *1/*3) or TT (CYP3A5 *1/*1) genotype, although this is contradicted in some studies. Other genetic and clinical factors may also influence dose of cyclosporine.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

- Class 2B **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) may require a lower dose of cyclosporine to reach target blood concentration as compared to patients with the CT (CYP3A5 *1/*3) or TT (CYP3A5 *1/*1) genotype, although this is contradicted in some studies. Other genetic and clinical factors may also influence dose of cyclosporine.

- Class 3 **rs35599367** *GG*

Patients with the GG genotype and organ transplantation administered cyclosporine may have a 1) increased metabolism of cyclosporine 2) increased clearance of cyclosporine and 3) a decreased risk in adverse events (e.g. graft rejection or kidney function) as compared to patients with the AA genotype. Other clinical and genetic factors may also affect metabolism and incidence of adverse events in organ transplant patients administered cyclosporine.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

- Class 3 **rs28371759** *AA*

Patients with the AA genotype (CYP3A4 *1/*1) who underwent kidney transplantation may have decreased metabolism of cyclosporine as compared to patients with the GG genotype (*18B/*18B). Other genetic and clinical factors may also influence metabolism of cyclosporine.

- Class 3 **rs35599367** *GG*

Patients with the GG genotype and organ transplantation administered cyclosporine may have a 1) increased metabolism of cyclosporine 2) increased clearance of cyclosporine and 3) a decreased risk in adverse events (e.g. graft rejection or kidney function) as compared to patients with the AA genotype. Other clinical and genetic factors may also affect metabolism and incidence of adverse events in organ transplant patients administered cyclosporine.

CYTARABINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*

  Patients with the GG genotype may have 1) decreased exposure to doxorubicin metabolites and 2) decreased response to anthracycline regimens as compared to patients with the AA genotype, however the evidence is highly contradictory. Other genetic and clinical factors may also influence response to anthracycline regimens.

- **Class 3** **rs1128503** *GG*

  Patients with the GG genotype and acute myeloid leukemia may have a poorer response when treated with cytarabine, alone or in combination with daunorubicin, or dexrazoxane as compared to patients with the AA or AG genotype, however some evidence contradicts this. Other genetic and clinical factors may also influence response to cytarabine.

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

- **Class 3** **rs2291075** *CT*

  Patients with the CT genotype may have more favorable event-free and overall survival in children with de novo acute myeloid leukemia (AML) treated with cytarabine, daunorubicin, etoposide and mitoxantrone as compared to patients with genotype CC. Other genetic and clinical factors may also influence the treatment outcome in acute myeloid leukemia.

DAUNORUBICIN

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

- **Class 3** **rs2291075** *CT*

  Patients with the CT genotype may have more favorable event-free and overall survival in children with de novo acute myeloid leukemia (AML) treated with cytarabine, daunorubicin, etoposide and mitoxantrone as compared to patients with genotype CC. Other genetic and clinical factors may also influence the treatment outcome in acute myeloid leukemia.

DEFERASIROX

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 3** **rs887829** *CT*

  Patients with the CT genotype and beta-thalassemia may have decreased concentrations of deferasirox as compared to patients with the TT genotype. Other genetic and clinical factors may also influence concentrations of deferasirox.

- **Class 3** **rs3806596** *TC*

Patients with the CT genotype and beta-thalassemia may have worse response to, and decreased concentrations of deferasirox as compared to patients with the CC genotype. Other clinical and genetic factors may also influence concentrations of and response to deferasirox in patients with beta-thalassemia.

- **Class 4** **rs4124874** *TG*

Pediatric patients with major thalassemia and the GT genotype may have an increased risk of adverse reactions when administered deferasirox as compared to patients with the TT genotype. Please note, the evidence comes solely from a single case study report of a single individual, a 3 year old female patient with major thalassemia of genotype GT, therefore there is no information for patients with the GG or TT genotypes.Other clinical and genetic factors may also influence risk of adverse reactions in patients with major thalassemia who are administered deferasirox.

- **Class 4** **rs10929302** *GA*

Pediatric patients with major thalassemia and the AG genotype may have an increased risk of adverse reactions when administered deferasirox as compared to patients with the GG genotype. Please note, the evidence comes solely from a single case study report of a single individual, a 3 year old female patient with major thalassemia of genotype AG, therefore there is no information for patients with the AA or GG genotypes.Other clinical and genetic factors may also influence risk of adverse reactions in patients with major thalassemia who are administered deferasirox.

- **Class 4** **rs4148323** *GG*

Pediatric patients with major thalassemia and the GG genotype may have a decreased risk of adverse reactions when administered deferasirox as compared to patients with the AA or AG genotype. Please note, the evidence comes solely from a single case study report of a single individual, a 3 year old female patient with major thalassemia of genotype AG, therefore there is no information for patients with the GG or AA genotypes.Other clinical and genetic factors may also influence risk of adverse reactions in patients with major thalassemia who are administered deferasirox.

UGT1A3 UDP glucuronosyltransferase 1 family, polypeptide A3

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs887829** *CT*

Patients with the CT genotype and beta-thalassemia may have decreased concentrations of deferasirox as compared to patients with the TT genotype. Other genetic and clinical factors may also influence concentrations of deferasirox.

- **Class 3** **rs3806596** *TC*

- **Class 3** **rs3806596** *TC*

Patients with the CT genotype and beta-thalassemia may have worse response to, and decreased concentrations of deferasirox as compared to patients with the CC genotype. Other clinical and genetic factors may also influence concentrations of and response to deferasirox in patients with beta-thalassemia.

- **Class 4** **rs4124874** *TG*

Pediatric patients with major thalassemia and the GT genotype may have an increased risk of adverse reactions when administered deferasirox as compared to patients with the TT genotype. Please note, the evidence comes solely from a single case study report of a single individual, a 3 year old female patient with major thalassemia of genotype GT, therefore there is no information for patients with the GG or TT genotypes.Other clinical and genetic factors may also influence risk of adverse reactions in patients with major thalassemia who are administered deferasirox.

- **Class 4** **rs10929302** *GA*

Pediatric patients with major thalassemia and the AG genotype may have an increased risk of adverse reactions when administered deferasirox as compared to patients with the GG genotype. Please note, the evidence comes solely from a single case study report of a single individual, a 3 year old female patient with major thalassemia of genotype AG, therefore there is no information for patients with the AA or GG genotypes.Other clinical and genetic factors may also influence risk of adverse reactions in patients with major thalassemia who are administered deferasirox.

- **Class 4** **rs4148323** *GG*

Pediatric patients with major thalassemia and the GG genotype may have a decreased risk of adverse reactions when administered deferasirox as compared to patients with the AA or AG genotype. Please note, the evidence comes solely from a single case study report of a single individual, a 3 year old female patient with major thalassemia of genotype AG, therefore there is no information for patients with the GG or AA genotypes.Other clinical and genetic factors may also influence risk of adverse reactions in patients with major thalassemia who are administered deferasirox.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs887829** *CT*

Patients with the CT genotype and beta-thalassemia may have decreased concentrations of deferasirox as compared to patients with the TT genotype. Other genetic and clinical factors may also influence concentrations of deferasirox.

- **Class 3** **rs3806596** *TC*

Patients with the CT genotype and beta-thalassemia may have worse response to, and decreased concentrations of deferasirox as compared to patients with the CC genotype. ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations

- **Class 3** **rs2273697** *GG*
  Patients with the GG genotype and beta-thalassemia may have decreased concentrations of deferasirox as compared to patients with the AG genotype. Other genetic and clinical factors may also influence concentrations of deferasirox.
- **Class 4** **rs717620** *CT*
  Pediatric patients with major thalassemia and the CT genotype may have an increased risk of adverse reactions when administered deferasirox as compared to patients with the CC genotype. Please note, the evidence comes solely from a single case study report of a 3 year old female patient with major thalassemia of genotype CT, therefore there is no information for patients with the CC or TT genotypes. Other clinical and genetic factors may also influence risk of adverse reactions in patients with major thalassemia who are administered deferasirox.

CYP1A2 cytochrome P450, family 1, subfamily A, polypeptide 2

- Clinical Annotations

- **Class 3** **rs762551** *AA*
  Patients with the AA genotype and beta-thalassemia may have decreased concentrations of deferasirox as compared to patients with the AC or CC genotype. Other genetic and clinical factors may also influence concentrations of deferasirox.
- **Class 3** **rs2470890** *TT*
  Patients with the TT genotype and beta-thalassemia may have decreased concentrations of deferasirox, possibly to levels below therapeutic efficacy, as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence concentrations of deferasirox.

DIURETICS

ADRB2 adrenoceptor beta 2, surface

- Clinical Annotations

- **Class 3** **rs1042713** *GG*
  Patients with the GG genotype and heart failure may have increased emergency department visits and hospital utilization when treated with cardiovascular drugs as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence efficacy of cardiovascular drugs.

ADRB1 adrenoceptor beta 1

- Clinical Annotations

- **Class 3** **rs1801253** *GG*
  Patients with the CC genotype and heart failure may have increased emergency department utilization when treated with cardiovascular drugs as compared to patients with the GG genotype. Other genetic and clinical factors may also influence efficacy of cardiovascular drugs.

DOBUTAMINE

ADRB1 adrenoceptor beta 1

– Clinical Annotations –

· **Class 3** **rs1801253** *GG*
Healthy males with the GG genotype may have smaller increases in fractional shortening and systolic blood pressure when given dobutamine, as compared to healthy males with the CC genotype. No significant differences were seen for heart rate. Other genetic and clinical factors may also influence fractional shortening and systolic blood pressure.

DOCETAXEL

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

– Clinical Annotations –

· **Class 3** **rs2740574** *TT*
Patients with the TT genotype may have decreased clearance of docetaxel and a decreased risk of an infusion-related reaction as compared to patients with the CC or CT genotype. These patients may experience a decreased risk of neurotoxicity with docetaxel treatment, though reports conflict. Other genetic and clinical factors may also influence clearance of and reactions to docetaxel.

CYP3A cytochrome P450, family 3, subfamily A

– Clinical Annotations –

· **Class 3** **rs2740574** *TT*
Patients with the TT genotype may have decreased clearance of docetaxel and a decreased risk of an infusion-related reaction as compared to patients with the CC or CT genotype. These patients may experience a decreased risk of neurotoxicity with docetaxel treatment, though reports conflict. Other genetic and clinical factors may also influence clearance of and reactions to docetaxel.

CYP4B1 cytochrome P450, family 4, subfamily B, polypeptide 1

– Clinical Annotations –

· **Class 3** **rs4646487** *CC*
Patients with the CC genotype may have a decreased but not absent risk of toxicity with docetaxel and thalidomide as compared to patients with the CT or TT genotypes. Other genetic and clinical factors may also influence treatment response.

NAT2 N-acetyltransferase 2 (arylamine N-acetyltransferase)

– Clinical Annotations –

· **Class 3** **rs1799931** *GG*
Patients with the GG genotype may have an increased risk of toxicity with docetaxel and thalidomide as compared to patients with the AA genotype. Other genetic and clinical factors may also influence treatment response.

VEGFA vascular endothelial growth factor A

- Clinical Annotations

- **Class 3** **rs1570360** *AG*
  Patients with the AG genotype and breast cancer may have a better response to docetaxel treatment as compared to patients with the GG genotype. However, contradictory evidence exists when considering progression-free survival. Other genetic and clinical factors may also influence response to docetaxel.
- **Class 3** **rs699947** *AC*
  Current literature evidence finds no significant effect of the AC genotype on progression-free survival time in patients taking docetaxel.
- **Class 3** **rs1570360** *AG*
  Patients with the AG genotype and prostate cancer may have longer progression-free survival time when treated with docetaxel plus oral metronomic cyclophosphamide as compared to patients with the AA genotype. Other genetic and clinical factors may also influence progression-free survival time.

HNF4A hepatocyte nuclear factor 4, alpha

- Clinical Annotations

- **Class 3** **rs2273618** *TC*
  Patients with nasopharyngeal cancer and the CT genotype may have more severe anemia when treated with docetaxel as compared to patients with the TT genotype. Other clinical and genetic factors may also influence severity of anemia in patients with nasopharyngeal cancer who are treated with docetaxel.
- **Class 3** **rs3746574** *TC*
  Patients with nasopharyngeal cancer and the CT genotype may have more severe anemia when treated with docetaxel as compared to patients with the TT genotype. Other clinical and genetic factors may also influence severity of anemia in patients with nasopharyngeal cancer who are treated with docetaxel.

DOXORUBICIN

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype may have 1) decreased exposure to doxorubicin metabolites and 2) decreased response to anthracycline regimens as compared to patients with the AA genotype, however the evidence is highly contradictory. Other genetic and clinical factors may also influence response to anthracycline regimens.
- **Class 3** **rs2032582** *CC*
  Patients with the CC genotype may have increased metabolism of doxorubicin in people with Breast Neoplasms as compared to patients with genotype AA. Other genetic and clinical factors may also influence the metabolism of doxorubicin.

EFAVIRENZ

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype and HIV infection who are treated with efavirenz may have reduced clearance of efavirenz as compared to patients with the AG genotype. Some studies have shown no association between this polymorphism and efavirenz clearance, plasma concentrations or exposure, or PBMC concentrations. Other genetic and clinical factors may also influence efavirenz pharmacokinetics.
- **Class 3** **rs2032582** *CC*
  Patients with the CC genotype may have increased likelihood of emerging viral drug resistance when exposed to efavirenz in people with HIV Infections as compared to patients with the AA genotype.This varaint is not associated with plasma exposure of efavirenz. Other genetic and clinical factors may also influence the response to efavirenz
- **Class 4** **rs1128503** *GG*
  Patients with GG genotype and HIV may have increased concentrations of efavirenz in plasma compared to patients with AA genotype. However, this association was not significant and was not found in another study of plasma and PBMCs. Other clinical and genetic factors may affect efavirenz concentrations.

CYP2A6 cytochrome P450, family 2, subfamily A, polypeptide 6

- Clinical Annotations

- **Class 3** **rs28399433** *AA*
  Patients with the AA genotype and HIV may have decreased plasma concentrations of efavirenz as compared to patients with the AC or CC genotype. Other genetic and clinical factors may also influence plasma concentrations of efavirenz.

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations

- **Class 2B** **rs4803419** *CC*
  Patients with HIV and the CC genotype may have lower plasma concentrations of efavirenz as compared to patients with the TT genotype. Other clinical and genetic factors may also influence plasma concentrations of efavirenz in patients with HIV.
- **Class 3** **rs8192709** *CC*
  Patients with genotype CC may have decreased metabolism of efavirenz in people with HIV Infections as compared to patients with genotype CT. Other genetic and clinical factors may also influence the metabolism of efavirenz.
- **Class 3** **rs8192719** *CC*
  Patients with the CC genotype and HIV may have decreased concentrations of efavirenz as compared to patients with the CT or TT genotype. Other genetic and clinical factors, such as rs3745274, may also influence concentrations of efavirenz.

ENALAPRIL

ADRB2 adrenoceptor beta 2, surface

- Clinical Annotations

· **Class 3** **rs1042714** *GG*
Patients with the GG genotype and left ventricular hypertrophy may have a greater percent reduction in left ventricular mass index when treated with enalapril as compared to patients with the CC genotype. Other genetic and clinical factors may also influence reduction in left ventricular mass index.

VEGFA vascular endothelial growth factor A

- Clinical Annotations

· **Class 3** **rs699947** *AC*
Patients with hypertension and the AC genotype may have an improved response to enalapril as compared to patients with the CC genotype. Other clinical and geneticc factors may also influence response to enalapril in patients with hypertension.

ERLOTINIB

CYP1A2 cytochrome P450, family 1, subfamily A, polypeptide 2

- Clinical Annotations

· **Class 3** **rs2472304** *AA*
Patients with the AA genotype may have increased concentrations of erlotinib as compared to patients with the GG genotype. Other genetic and clinical factors may also influence concentrations of erlotinib.

ESCITALOPRAM

CYP2D6 cytochrome P450, family 2, subfamily D, polypeptide 6

- Clinical Annotations

· **Class 3** **rs1065852** *GG*
Patients with the GG genotype and depression may have a increased response and remission rate when treated with escitalopram as compared to patients with the AA genotype. Other genetic and clinical factors may also effect patients response.

ETHAMBUTOL

NAT2 N-acetyltransferase 2 (arylamine N-acetyltransferase)

- Clinical Annotations

· **Class 2A** **rs1041983** *TT*
Patients with the TT genotype and tuberculosis (TB) may have an increased risk for hepatotoxicity when treated with anti-TB drugs as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk for hepatotoxicity.

- **Class 2A** **rs1799930** *AA*
  Patients with the AA genotype and tuberculosis (TB) may have an increased risk of hepatotoxicity when treated with anti-TB drugs as compared to patients with the GG genotype. They also may have decreased clearance of isoniazid as compared to those with the AG or GG genotype. Other genetic and clinical factors may also influence risk for hepatotoxicity and clearance of isoniazid.
- **Class 3** **rs1799931** *GG*
  Patients with the GG genotype and tuberculosis (TB) may have a decreased risk of hepatotoxicity when treated with anti-TB drugs as compared to patients with the AA or AG genotype. However, some studies find no association with hepatotoxicity. Other genetic and clinical factors may also influence risk of hepatotoxicity.

ETHANOL

CHRNA3 cholinergic receptor, nicotinic, alpha 3 (neuronal)

- Clinical Annotations

- **Class 3** **rs16969968** *GG*
  Patients with the GG genotype may have an increased risk for alcoholism as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of alcoholism.

CHRNA5 cholinergic receptor, nicotinic, alpha 5 (neuronal)

- Clinical Annotations

- **Class 3** **rs16969968** *GG*
  Patients with the GG genotype may have an increased risk for alcoholism as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of alcoholism.

ETOPOSIDE

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

- **Class 3** **rs2291075** *CT*
  Patients with the CT genotype may have more favorable event-free and overall survival in children with de novo acute myeloid leukemia (AML) treated with cytarabine, daunorubicin, etoposide and mitoxantrone as compared to patients with genotype CC. Other genetic and clinical factors may also influence the treatment outcome in acute myeloid leukemia.

FEXOFENADINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*

Healthy individuals with the GG genotype who are treated with fexofenadine may have higher plasma drug levels as compared with healthy individuals with the AA genotype. Another study found no association with fexofenadine plasma concentrations. Other genetic and clinical factors may also influence plasma concentrations of fexofenadine and dose requirements.

FLUOROURACIL

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*

Patients with GG genotype may have decreased risk of diarrhea when treated with fluorouracil in people with Colorectal Neoplasms as compared to patients with genotype AA. Other genetic and clinical factors may also impact a patients response to fluorouracil.

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations

· **Class 3** **rs717620** *CT*

Patients with the CT genotype and colon cancer may have a decreased risk of thrombocytopenia when treated with FOLFOX (fluorouracil, leucovorin, oxaliplatin) as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk of thrombocytopenia.

· **Class 3** **rs717620** *CT*

Patients with the CT genotype and colorectal cancer may have decreased severity of neurotoxicity syndromes when treated with FOLFOX (fluorouracil, leucovorin, oxaliplatin) as compared to patients with the TT genotype. Other genetic and clinical factors may also influence severity of neurotoxicity syndromes.

CYP1B1 cytochrome P450, family 1, subfamily B, polypeptide 1

- Clinical Annotations

· **Class 3** **rs1056836** *GG*

Patients with the GG genotype and breast cancer may have a better response when treated with cyclophosphamide, epirubicin and fluorouracil as compared to patients with the CC genotype. Other genetic and clinical factors may also influence response to treatment with cyclophosphamide, epirubicin and fluorouracil. (Note: with a C/G variant, particularly in a gene on the minus chromosomal strand, and frequencies close to 50

DPYD dihydropyrimidine dehydrogenase

- Dosing Guideline

DPYD:*1/*1 Moderate

Use label-recommended dosage and administration.

- **Class 1A** **rs55886062** *AA*

Patients with the AA genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have a decreased, but not absent, risk for drug toxicity as compared to patients with the AC or CC genotype (DPYD *1/*13 or *13/*13). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 1A** **rs3918290** *CC*

Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of fluoropyrimidine drugs and 2) decreased, but not non-existent, risk for drug toxicity as compared to patients with the CT or TT genotype (DPYD *1/*2A or *2A/*2A). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine based chemotherapy.

- **Class 1A** **rs67376798** *TT*

Patients with the TT genotype and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of the drug and 2) decreased, but not absent, risk and reduced severity of drug toxicity as compared to patients with the AT genotype. Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801160** *CC*

Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased metabolism of fluorouracil and 2) decreased risk for drug toxicities as compared to patients with the CT or TT genotype (DPYD *1/*6 or *6/*6). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin) or with other drugs such as bevacizumab, cetuximab, raltitrexed. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801159** *TT*

Patients with the TT genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) a decreased likelihood of nausea, vomiting, and leukopenia, 2) increased response and 3) increased clearance of fluorouracil as compared to patients with the CT or CC genotype (DPYD *1/*5 or *5/*5). However, other studies find no associations or contradictory associations with fluoropyrimidine-induced drug toxicity or response. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801265** *GA*

Patients with the AG genotype (DPYD *1/*9A) and cancer who are treated with fluorouracil may have 1) an increased risk for drug toxicities, 2) decreased response and 3) increased DPYD activity as compared to patients with the AA genotype (DPYD *1/*1). Patients with the AG genotype were also found to have increased clearance of fluorouracil as compared to those with the GG genotype (DPYD *9A/*9A). However, multiple studies find contradictory or negative evidence for drug toxicities, fluorouracil clearance, and DPYD activity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

- **Class 3** **rs1801158** *CC*

  Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) a decreased but not absent risk of toxicity and 2) increased DPYD activity as compared to patients with the CT genotype (DPYD *1/*4). However, some studies find no association with drug toxicity or DPYD activity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.
- **Class 4** **rs1801266** *GG*

  Patients with the GG genotype (DPYD *1/*1) may have increased DPYD activity as compared to those with the AA or AG genotype (DPYD *8/*8 or *1/*8). Other genetic and clinical factors may also affect DPYD activity.
- **Class 4** **rs1801268** *CC*

  Patients with the CC genotype (DPYD *1/*1) may have increased DPYD activity as compared to those with the AC or AA genotype (DPYD *1/*10 or *10/*10). Other genetic and clinical factors may also affect DPYD activity.
- **Class 4** **rs72549306** *CC*

  Patients with the CC genotype (DPYD *1/*1) may have increased DPYD activity as compared to those with the AA or AC genotype (DPYD *11/*11 or *1/*11). Other genetic and clinical factors may also affect DPYD activity.

VEGFA vascular endothelial growth factor A

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs699947** *AC*

  Patients with colorectal cancer and the AC genotype may have a reduced response to bevacizumab, capecitabine, fluorouracil, irinotecan, leucovorin, or oxaliplatin as compared to patients with the CC genotype. Other clinical and genetic factors may also affect response to chemotherapy in people with colorectal cancer.

IGFBP3 insulin-like growth factor binding protein 3

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs2854744** *GG*

  Patients with the GG genotype and stomach cancer may have a poorer survival outcomes when treated with fluorouracil as compared to patients with the GT or TT genotype. Other genetic and clinical factors may also influence survival outcome.

FLUVASTATIN

SLCO1B1 solute carrier organic anion transporter family, member 1B1

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs11045819** *CC*

  Patients with the CC genotype who are treated with fluvastatin may have a lesser reduction in LDL-C as compared to patients with the AC and AA genotype.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

· **Class 3** **rs4986910** *AA*
Patients with the AA genotype may have a smaller increase in HDL cholesterol when treated with fluvastatin as compared to patients with the AG genotype. Other genetic and clinical factors may also influence HDL cholesterol response.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

· **Class 3** **rs4986910** *AA*
Patients with the AA genotype may have a smaller increase in HDL cholesterol when treated with fluvastatin as compared to patients with the AG genotype. Other genetic and clinical factors may also influence HDL cholesterol response.

GEFITINIB

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1128503** *GG*
Patients with the GG genotype and non-small cell lung cancer may have a decreased risk for diarrhea and skin rash when treated with gefitinib as compared to patients with the AA genotype. Other genetic and clinical factors may also influence drug toxicity risk in patients receiving gefitinib.

GEMCITABINE

CDA cytidine deaminase

- Clinical Annotations

· **Class 3** **rs1048977** *CT*
Patients with cancer and the CT genotype may have increased metabolism of gemcitabine as compared to patients with the TT genotype. However, this has been contradicted by some studies. Other genetic and clinical factors may also influence metabolism of gemcitabine.

HALOPERIDOL

COMT catechol-O-methyltransferase

- Clinical Annotations

· **Class 3** **rs4680** *GA*

Patients with the AG genotype and schizophrenia may have an increased risk for developing extrapyramidal symptoms when treated with haloperidol as compared to patients with the AA or GG genotype. Other genetic and clinical factors may also influence risk for extrapyramidal symptoms when taking haloperidol.

HMG COA REDUCTASE INHIBITORS

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype may have decreased serum creatine kinase levels when treated with hmg CoA reductase inhibitors as compared to patients with the AA genotype. Other genetic and clinical factors may also influence serum creatine kinase levels.
- **Class 3** **rs1128503** *GG*
  Patients with the GG genotype may have decreased serum creatine kinase levels when treated with hmg CoA reductase inhibitors as compared to patients with the AA genotypes. Other genetic and clinical factors may also influence serum creatine kinase levels.

ILOPERIDONE

CYP2D6 cytochrome P450, family 2, subfamily D, polypeptide 6

- Clinical Annotations

- **Class 3** **rs1065852** *GG*
  Patients with the GG genotype and schizophrenia may have an increased QTc interval when treated with iloperidone as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence QTc interval.

IMATINIB

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype and chronic myeloid leukemia may have an increased likelihood of achieving complete molecular response when treated with imatinib, as compared to patients with the AA or AG genotype. However, this was only significant in an exclusively Caucasian population. Additionally, no significant results were seen when considering major molecular response. Other genetic and clinical factors may also influence likelihood of achieving complete molecular response.
- **Class 3** **rs1128503** *GG*
  Patients with the GG genotype and chronic myeloid leukemia may have a better response to imatinib treatment as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence response to imatinib.

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations

· **Class 3** **rs3745274** *GG*

Patients with the GG genotype and chronic myeloid leukemia may have a 1) a better response to treatment with imatinib as compared to patients with the TT genotype, 2) an increased risk of developing cytogenetic resistance to imatinib as compared to patients with the GT genotype, and 3) a greater risk for side effects as compared to patients with the GT or TT genotype. Other genetic and clinical factors may also influence response, resistance and risk of side effects in patients taking imatinib.

CYP2A7P1 cytochrome P450, family 2, subfamily A, polypeptide 7 pseudogene 1

- Clinical Annotations

· **Class 3** **rs3745274** *GG*

Patients with the GG genotype and chronic myeloid leukemia may have a 1) a better response to treatment with imatinib as compared to patients with the TT genotype, 2) an increased risk of developing cytogenetic resistance to imatinib as compared to patients with the GT genotype, and 3) a greater risk for side effects as compared to patients with the GT or TT genotype. Other genetic and clinical factors may also influence response, resistance and risk of side effects in patients taking imatinib.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations

· **Class 3** **rs776746** *CC*

Patients with the CC genotype and chronic myeloid leukemia have have increased trough concentrations of imatinib compared to patients with the CT and TT genotypes. Other genetic and clinical factors may affect concentrations of imatinib.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

· **Class 3** **rs776746** *CC*

Patients with the CC genotype and chronic myeloid leukemia have have increased trough concentrations of imatinib compared to patients with the CT and TT genotypes. Other genetic and clinical factors may affect concentrations of imatinib.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

· **Class 3** **rs776746** *CC*

Patients with the CC genotype and chronic myeloid leukemia have have increased trough concentrations of imatinib compared to patients with the CT and TT genotypes. Other genetic and clinical factors may affect concentrations of imatinib.

IRBESARTAN

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

- Clinical Annotations

- **Class 3** **rs1057910** *AC*
  Patients with the AC genotype and essential hypertension may have decreased metabolism or clearance of irbesartan as compared to patients with the AA genotype, but may have no difference in response. Other clinical or genetic factors may also influence concentrations of irbesartan in patients with essential hypertension.
- **Class 3** **rs72558187** *TT*
  Individuals with the TT genotype may have increased metabolism and clearance of irbesartan which may result may in decreased exposure of irbesartan as compared to patients with the CT genotype. Other clinical and genetic factors may also influence metabolism of irbesartan.

IRINOTECAN

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

- **Class 3** **rs4149056** *TT*
  Patients with the TT genotype and cancer may have a decreased risk of neutropenia when treated with irinotecan or irinotecan-based regimens, as compared to patients with the CC or CT genotype. However, a different study of similar size found no association between the TT genotype and neutropenia. No significant results have been seen for diarrhea. Other genetic and clinical factors may also influence risk of neutropenia or diarrhea.
- **Class 3** **rs4149015** *GG*
  Patients with the GG genotype and non-small cell lung cancer may have a decreased risk of neutropenia when treated with irinotecan as compared to patients with the AG or GG genotype. No association has been seen for diarrhea. Other genetic and clinical factors may also influence risk of neutropenia.
- **Class 3** **rs2306283** *AG*
  Patients with the AG genotype and solid tumors may experience increased risk of neutropenia compared to patients with the AA genotype. However, studies conflict as to this association. Other clinical and genetic factors may affect risk of neutropenia with irinotecan therapy.

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 3** **rs3832043** *T/del*
  Patients with the T/del genotype and non-small cell lung cancer may have a decreased risk of diarrhea when treated with irinotecan or irinotecan-based regimens as compared to patients with the del/del genotype. However, a different study of similar size found no association between this genotype and diarrhea. No significant results have been seen when considering neutropenia or tumor response. Other genetic and clinical factors may also influence risk of diarrhea.
- **Class 3** **rs11692021** *TC*

Patients with the CT genotype and colorectal cancer may have an increased risk for severe neutropenia when treated with irinotecan as compared to patients with the TT genotype, or a decreased risk as compared to patients with the CC genotype. This may be due to decreased enzymatic activity toward SN-38, the active metabolite of irinotecan, found in cells with the C allele as compared to those with the T allele. Other genetic and clinical factors, such as UGT1A1*28, may also influence the risk for neutropenia in patients taking irinotecan.

- **Class 3** **rs2070959** *AG*

Patients with the AG genotype and colorectal cancer may have an increased risk for severe neutropenia when treated with irinotecan as compared to patients with the GG genotype, or a decreased risk as compared to patients with the AA genotype. Other genetic and clinical factors, such as UGT1A1*28, may also influence the risk for neutropenia in patients taking irinotecan.

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

- **Class 3** **rs3832043** *T/del*

Patients with the T/del genotype and non-small cell lung cancer may have a decreased risk of diarrhea when treated with irinotecan or irinotecan-based regimens as compared to patients with the del/del genotype. However, a different study of similar size found no association between this genotype and diarrhea. No significant results have been seen when considering neutropenia or tumor response. Other genetic and clinical factors may also influence risk of diarrhea.

- **Class 3** **rs11692021** *TC*

Patients with the CT genotype and colorectal cancer may have an increased risk for severe neutropenia when treated with irinotecan as compared to patients with the TT genotype, or a decreased risk as compared to patients with the CC genotype. This may be due to decreased enzymatic activity toward SN-38, the active metabolite of irinotecan, found in cells with the C allele as compared to those with the T allele. Other genetic and clinical factors, such as UGT1A1*28, may also influence the risk for neutropenia in patients taking irinotecan.

- **Class 3** **rs2070959** *AG*

Patients with the AG genotype and colorectal cancer may have an increased risk for severe neutropenia when treated with irinotecan as compared to patients with the GG genotype, or a decreased risk as compared to patients with the AA genotype. Other genetic and clinical factors, such as UGT1A1*28, may also influence the risk for neutropenia in patients taking irinotecan.

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations

- **Class 3** **rs3832043** *T/del*

Patients with the T/del genotype and non-small cell lung cancer may have a decreased risk of diarrhea when treated with irinotecan or irinotecan-based regimens as compared to patients with the del/del

genotype. However, a different study of similar size found no association between this genotype and diarrhea. No significant results have been seen when considering neutropenia or tumor response. Other genetic and clinical factors may also influence risk of diarrhea.

- **Class 3** **rs11692021** *TC*

Patients with the CT genotype and colorectal cancer may have an increased risk for severe neutropenia when treated with irinotecan as compared to patients with the TT genotype, or a decreased risk as compared to patients with the CC genotype. This may be due to decreased enzymatic activity toward SN-38, the active metabolite of irinotecan, found in cells with the C allele as compared to those with the T allele. Other genetic and clinical factors, such as UGT1A1*28, may also influence the risk for neutropenia in patients taking irinotecan.

- **Class 3** **rs2070959** *AG*

Patients with the AG genotype and colorectal cancer may have an increased risk for severe neutropenia when treated with irinotecan as compared to patients with the GG genotype, or a decreased risk as compared to patients with the AA genotype. Other genetic and clinical factors, such as UGT1A1*28, may also influence the risk for neutropenia in patients taking irinotecan.

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs2273697** *GG*

Patients with the GG genotype and colorectal cancer may have decreased metabolism of irinotecan as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence metabolism of irinotecan.

- **Class 3** **rs3740066** *CT*

Patients with the CT genotype and non-small cell lung cancer may have a decreased risk of diarrhea when treated with irinotecan as compared to patients with the CC genotype. No association has been seen for neutropenia. Other genetic and clinical factors may also influence risk of diarrhea.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs11692021** *TC*

Patients with the CT genotype and colorectal cancer may have an increased risk for severe neutropenia when treated with irinotecan as compared to patients with the TT genotype, or a decreased risk as compared to patients with the CC genotype. Other genetic and clinical factors, such as UGT1A1*28, may also influence the risk for neutropenia in patients taking irinotecan.

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

UGT1A3 UDP glucuronosyltransferase 1 family, polypeptide A3

- Clinical Annotations

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

UGT1A5 UDP glucuronosyltransferase 1 family, polypeptide A5

- Clinical Annotations

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

UGT1A1 UDP glucuronosyltransferase 1 family, polypeptide A1

- Clinical Annotations

- **Class 3** **rs10929302** *GA*

The AG genotype may be associated with a reduced risk for irinotecan-induced grade 3 or 4 hematological and gastrointestinal toxicities, including neutropenia and diarrhea, as compared to the AA genotype.

VEGFA vascular endothelial growth factor A

- Clinical Annotations

- **Class 3** **rs699947** *AC*

Patients with colorectal cancer and the AC genotype may have a reduced response to bevacizumab, capecitabine, fluorouracil, irinotecan, leucovorin, or oxaliplatin as compared to patients with the CC genotype. Other clinical and genetic factors may also affect response to chemotherapy in people with colorectal cancer.

ISONIAZID

NAT2 N-acetyltransferase 2 (arylamine N-acetyltransferase)

- Clinical Annotations

- **Class 2A** **rs1041983** *TT*

Patients with the TT genotype and tuberculosis (TB) may have an increased risk for hepatotoxicity when treated with anti-TB drugs as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk for hepatotoxicity.

- **Class 2A** **rs1799930** *AA*

Patients with the AA genotype and tuberculosis (TB) may have an increased risk of hepatotoxicity when treated with anti-TB drugs as compared to patients with the GG genotype. They also may have decreased clearance of isoniazid as compared to those with the AG or GG genotype. Other genetic and clinical factors may also influence risk for hepatotoxicity and clearance of isoniazid.

- **Class 3** **rs1799931** *GG*

Patients with the GG genotype and tuberculosis (TB) may have a decreased risk of hepatotoxicity when treated with anti-TB drugs as compared to patients with the AA or AG genotype. However, some studies find no association with hepatotoxicity. Other genetic and clinical factors may also influence risk of hepatotoxicity.

IVACAFTOR

CFTR cystic fibrosis transmembrane conductance regulator (ATP-binding cassette sub-family C, member 7)

- Clinical Annotations

- **Class 1A** **rs78655421** *GG*
  Patients with the GG genotype and cystic fibrosis may not respond when treated with ivacaftor as compared to patients with the AA and AG genotypes. Other genetic and clinical factors may also influence the efficacy of ivacaftor.

LAMIVUDINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype and HIV may have an increased risk of virological failure when receiving highly active antiretroviral therapy (HAART), as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of virological failure on HAART.

LAMOTRIGINE

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 2B** **rs2011425** *TT*
  Patients with the TT genotype and epilepsy who are administered lamotrigine may have increased serum concentrations of lamotrigine, as well as improved response to lamotrigine, and may need a higher dose as compared to patients with the GG genotype. Other clinical and genetic factors may also influence metabolism, response, and dose of lamotrigine.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

- **Class 2B** **rs2011425** *TT*
  Patients with the TT genotype and epilepsy who are administered lamotrigine may have increased serum concentrations of lamotrigine, as well as improved response to lamotrigine, and may need a higher dose as compared to patients with the GG genotype. Other clinical and genetic factors may also influence metabolism, response, and dose of lamotrigine.

UGT1A5 UDP glucuronosyltransferase 1 family, polypeptide A5

- Clinical Annotations

- **Class 2B** **rs2011425** *TT*

Patients with the TT genotype and epilepsy who are administered lamotrigine may have increased serum concentrations of lamotrigine, as well as improved response to lamotrigine, and may need a higher dose as compared to patients with the GG genotype. Other clinical and genetic factors may also influence metabolism, response, and dose of lamotrigine.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

- Clinical Annotations

· Class 2B **rs2011425** *TT*

Patients with the TT genotype and epilepsy who are administered lamotrigine may have increased serum concentrations of lamotrigine, as well as improved response to lamotrigine, and may need a higher dose as compared to patients with the GG genotype. Other clinical and genetic factors may also influence metabolism, response, and dose of lamotrigine.

UGT1A7 UDP glucuronosyltransferase 1 family, polypeptide A7

- Clinical Annotations

· Class 2B **rs2011425** *TT*

Patients with the TT genotype and epilepsy who are administered lamotrigine may have increased serum concentrations of lamotrigine, as well as improved response to lamotrigine, and may need a higher dose as compared to patients with the GG genotype. Other clinical and genetic factors may also influence metabolism, response, and dose of lamotrigine.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

· Class 2B **rs2011425** *TT*

Patients with the TT genotype and epilepsy who are administered lamotrigine may have increased serum concentrations of lamotrigine, as well as improved response to lamotrigine, and may need a higher dose as compared to patients with the GG genotype. Other clinical and genetic factors may also influence metabolism, response, and dose of lamotrigine.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations

· Class 2B **rs2011425** *TT*

Patients with the TT genotype and epilepsy who are administered lamotrigine may have increased serum concentrations of lamotrigine, as well as improved response to lamotrigine, and may need a higher dose as compared to patients with the GG genotype. Other clinical and genetic factors may also influence metabolism, response, and dose of lamotrigine.

LORAZEPAM

UGT2B15 UDP glucuronosyltransferase 2 family, polypeptide B15

- Clinical Annotations

· **Class 2B** **rs1902023** *AC*
Subjects with the AC genotype may have decreased clearance of oxazepam or lorazepam as compared to subjects with the CC genotype, or increased clearance as compared to subjects with the AA genotype. Other genetic and clinical factors may also influence the oral clearance of oxazepam or lorazepam.

LOSARTAN

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

- Clinical Annotations

· **Class 3** **rs1057910** *AC*
Subjects with the AC genotype who are treated with losartan may have decreased metabolism of losartan as compared to subjects with the AA genotype. Other genetic and clinical factors may also influence metabolism of losartan.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*
Patients with the GG genotype may have poorer response to losartan in people with hypertension as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence the response to losartan.

MERCAPTOPURINE

TPMT thiopurine S-methyltransferase

- Clinical Annotations

· **Class 3** **rs1142345** *TT*
Pediatric patients with the TT genotype and Precursor Cell Lymphoblastic Leukemia-Lymphoma may experience decreased GI toxicity when treated with mercaptopurine and may require an increased dose as compared to patients with the CT or CC genotypes. Other genetic and clinical factors may also influence the likelihood of GI toxicity and dose of mercaptopurine in pediatric patients with Precursor Cell Lymphoblastic Leukemia-Lymphoma.

· **Class 4** **rs3931660** *AA*
Patients with the AA genotype may have increased TPMT activity toward mercaptopurine as compared to patients with the AT genotype. Other genetic and clinical factors may also influence TPMT activity.

METHADONE

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations

- **Class 2A** **rs3745274** *GG*
  Patients with the GG genotype who are being treated with methadone for heroin addiction may require an increased dose of the drug as compared to patients with the TT genotype. Other genetic and clinical factors may also influence dose of methadone.
- **Class 3** **rs2279343** *AA*
  Patients with the AA genotype who are being treated with methadone for heroin addiction may require an increased dose of the drug as compared to patients with the GG genotype. However, one study found no association between this variant and methadone dose. Other genetic and clinical factors may also influence dose of methadone.

CYP2A7P1 cytochrome P450, family 2, subfamily A, polypeptide 7 pseudogene 1

- Clinical Annotations

- **Class 2A** **rs3745274** *GG*
  Patients with the GG genotype who are being treated with methadone for heroin addiction may require an increased dose of the drug as compared to patients with the TT genotype. Other genetic and clinical factors may also influence dose of methadone.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

- **Class 3** **rs2242480** *CC*
  Patients with genotype CC may have decreased severity of opioid withdrawal symptoms and side effects when treated with methadone in people with Heroin Dependence as compared to patients with genotype TT or CT. Other genetic and clinical factors may also influence the response to methadone.
- **Class 3** **rs3735451** *TT*
  Patients with the TT genotype who are heroin dependent may have less severe side effects and opioid withdrawal symptoms when treated with methadone as compared to patients with the CC genotype. Other genetic and clinical factors may also influence side effects and opioid withdrawal symptoms in patients receiving methadone.

METHOTREXATE

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

- **Class 3** **rs4149056** *TT*
  Pediatric patients with the TT genotype and acute lymphoblastic leukemia may have increased clearance of methotrexate as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence clearance of methotrexate.
- **Class 3** **rs2306283** *AG*
  Pediatric patients with the AG genotype and acute lymphoblastic leukemia may have increased clearance of methotrexate as compared to patients with the GG genotype. Other genetic and clinical factors may also influence clearance of methotrexate.

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations -

- **Class 3** **rs717620** *CT*
Patients with the CT genotype may have increased clearance and distribution of volume of methotrexate as compared to patients with the CC genotype. Please note: the opposite effect was observed in a study done in an Asian population with various types of lymphomas. The T allele was associated with decreased clearance of methotrexate. Other clinical and genetic factors may also affect clearance and distribution of volume of methotrexate.
- **Class 3** **rs717620** *CT*
Patients with lymphoblastic leukemia-lymphoma and the CT genotype may have an increased risk of drug toxicity and decreased clearance of methotrexate when treated with methotrexate as compared to patients with the CC genotype. Please note: the opposite effect was observed in a study done in a French population with various types of lymphomas. The C allele was associated with decreased clearance of methotrexate. Other clinical and genetic factors may also influence risk of drug toxicity when treated with methotrexate.

METOPROLOL

ADRB2 adrenoceptor beta 2, surface

- Clinical Annotations -

- **Class 3** **rs1042714** *GG*
Patients with the GG genotype and hypertension may have an increased risk of developing hypertriglyceridemia when treated with atenolol or metoprolol as compared to patients with the CC or CG genotype. Other genetic and clinical factors may also influence risk of hypertriglyceridemia.

MIDAZOLAM

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations -

- **Class 3** **rs35599367** *GG*
Patients with the GG genotype and tumors may have increased metabolism of midazolam as compared to patients with the AG genotype. Other genetic and clinical factors may also influence metabolism of midazolam.
- **Class 4** **rs12721627** *GG*
The expression of a construct caring the G variant is not associated with decreased clearance of midazolam in transfected cells.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations -

- **Class 3** **rs35599367** *GG*

Patients with the GG genotype and tumors may have increased metabolism of midazolam as compared to patients with the AG genotype. Other genetic and clinical factors may also influence metabolism of midazolam.

- **Class 4** **rs12721627** *GG*

The expression of a construct caring the G variant is not associated with decreased clearance of midazolam in transfected cells.

MORPHINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype may have decreased pain reduction when treated with morphine in cancer patients as compared to patients with genotype AA. Other genetic and clinical factors may also influence response to morphine.

NEVIRAPINE

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations

- **Class 2A** **rs3745274** *GG*

Patients with the GG genotype and HIV infection may have increased clearance of and decreased exposure to nevirapine as compared to patients with the TT or GT genotype. Other genetic and clinical factors may also influence clearance of nevirapine and exposure to drug.

- **Class 3** **rs28399499** *TT*

Patients with the TT genotype and HIV may have a decreased risk for Stevens-Johnson Syndrome/toxic epidermal necrolysis (SJS/TEN) when treated with nevirapine as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence risk for developing SJS/TEN when receiving nevirapine.

CYP2A7P1 cytochrome P450, family 2, subfamily A, polypeptide 7 pseudogene 1

- Clinical Annotations

- **Class 2A** **rs3745274** *GG*

Patients with the GG genotype and HIV infection may have increased clearance of and decreased exposure to nevirapine as compared to patients with the TT or GT genotype. Other genetic and clinical factors may also influence clearance of nevirapine and exposure to drug.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations

- **Class 3** **rs776746** *CC*

Patients with the CC genotype and HIV infection who are treated with nevirapine may have increased clearance of the drug as compared to patients with the CT and TT genotype. Association with clearance was not found in a larger cohort in a separate study. Patients may also have differences in alanine aminotransferase levels, but association with toxicity has not been reported. Other genetic and clinical factors may also influence clearance of nevirapine.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

· **Class 3** **rs776746** *CC*

Patients with the CC genotype and HIV infection who are treated with nevirapine may have increased clearance of the drug as compared to patients with the CT and TT genotype. Association with clearance was not found in a larger cohort in a separate study. Patients may also have differences in alanine aminotransferase levels, but association with toxicity has not been reported. Other genetic and clinical factors may also influence clearance of nevirapine.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

· **Class 3** **rs776746** *CC*

Patients with the CC genotype and HIV infection who are treated with nevirapine may have increased clearance of the drug as compared to patients with the CT and TT genotype. Association with clearance was not found in a larger cohort in a separate study. Patients may also have differences in alanine aminotransferase levels, but association with toxicity has not been reported. Other genetic and clinical factors may also influence clearance of nevirapine.

ABCC10 ATP-binding cassette, sub-family C (CFTR/MRP), member 10

- Clinical Annotations

· **Class 3** **rs2125739** *TT*

Patients with the TT genotype and HIV may have increased concentrations of nevirapine as compared to patients with the CC genotype. Other genetic and clinical factors may also influence concentrations of nevirapine.

CYP2D6 cytochrome P450, family 2, subfamily D, polypeptide 6

- Clinical Annotations

· **Class 3** **rs28371706** *GG*

Pediatric patients with the GG genotype and HIV may have increased clearance of nevirapine as compared to pediatric patients with the AA or AG genotype. No significant association was seen in adults. Other genetic and clinical factors may also influence clearance of nevirapine.

NICOTINE

CYP2A6 cytochrome P450, family 2, subfamily A, polypeptide 6

- Clinical Annotations -

· **Class 4** **rs5031016** *AA*

Patients with the AA genotype may have increased metabolism of nicotine as compared to patients with the GG or AG genotype. Other variants within the CYP2A6 gene should be considered - allele G of this SNP is part of the *7, *10, *19, *36, *37 CYP2A6 alleles. Other genetic and clinical factors may also influence metabolism of nicotine.

DDC dopa decarboxylase (aromatic L-amino acid decarboxylase)

- Clinical Annotations -

· **Class 3** **rs12718541** *GG*

Patients with the GG genotype who smoke tobacco may have a decreased risk of addiction as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of smoking addiction.

NIFEDIPINE

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations -

· **Class 4** **rs4987161** *AA*

In vitro, the construct expressing the wild type allelic protein has average nifedipine metabolism.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations -

· **Class 3** **rs776746** *CC*

Pregnant women with the CC genotype may have decreased clearance of nifedipine as compared to women with the CT or TT genotype. Other genetic and clinical factors may also influence clearance of nifedipine.

· **Class 4** **rs4987161** *AA*

In vitro, the construct expressing the wild type allelic protein has average nifedipine metabolism.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations -

· **Class 3** **rs776746** *CC*

Pregnant women with the CC genotype may have decreased clearance of nifedipine as compared to women with the CT or TT genotype. Other genetic and clinical factors may also influence clearance of nifedipine.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

· **Class 3** **rs776746** *CC*
Pregnant women with the CC genotype may have decreased clearance of nifedipine as compared to women with the CT or TT genotype. Other genetic and clinical factors may also influence clearance of nifedipine.

ONDANSETRON

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations

· **Class 3** **rs776746** *CC*
Patients with the CC genotype may have increased metabolism of ondansetron as compared to patients with the TT genotype. Other genetic and clinical factors may also influence metabolism of ondansetron.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

· **Class 3** **rs776746** *CC*
Patients with the CC genotype may have increased metabolism of ondansetron as compared to patients with the TT genotype. Other genetic and clinical factors may also influence metabolism of ondansetron.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

· **Class 3** **rs776746** *CC*
Patients with the CC genotype may have increased metabolism of ondansetron as compared to patients with the TT genotype. Other genetic and clinical factors may also influence metabolism of ondansetron.

OPIOIDS

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*
Patients with the GG genotype may have a decreased risk of opioid dependence when exposed to opioids as compared to patients with the AG genotype. Other clinical and genetic factors may also influence risk of opioid dependence upon exposure to opioids.

COMT catechol-O-methyltransferase

- Clinical Annotations

- **Class 3** **rs4680** *GA*
  Patients with the AG genotype with substance withdrawal syndrome may have an increased likelihood of headache when discontinuing the use of analgesics (such as opioids, NSAIDs, triptans, ergot) as compared to patients with the AA genotype. Other clinical and genetic factors may also influence likelihood of headache in patients with withdrawal syndrome who discontinue the use of analgesics.

PACLITAXEL

CYP2C8 cytochrome P450, family 2, subfamily C, polypeptide 8

- Clinical Annotations

- **Class 4** **rs11572103** *TT*
  Patients with the TT genotype may have increased clearance of paclitaxel as compared to patients with the AA or AT genotypes, however this has not been shown in vivo. Other genetic and clinical factors may also influence clearance of paclitaxel.
- **Class 4** **rs11572080** *CC*
  Patients with the CC genotype may have increased clearance of paclitaxel as compared to patients with the CT or TT genotypes, however this has not been shown in vivo. Other genetic and clinical factors may also influence clearance of paclitaxel.
- **Class 4** **rs10509681** *TT*
  Patients with the TT genotype may have increased metabolism of paclitaxel as compared to patients with the CT or CC genotypes, however this has not been shown in vivo. Other genetic and clinical factors may also influence clearance of paclitaxel.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

- **Class 3** **rs12721627** *GG*
  Patients with the GG genotype may have increased metabolism of paclitaxel as compared to patients with the CC or CG genotypes. Other genetic and clinical factors may also influence paclitaxel metabolism.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

- **Class 3** **rs12721627** *GG*
  Patients with the GG genotype may have increased metabolism of paclitaxel as compared to patients with the CC or CG genotypes. Other genetic and clinical factors may also influence paclitaxel metabolism.
- **Class 3** **rs776746** *CC*
  Patients with the CC genotype may have decreased but not absent risk of neurotoxicity when treated with paclitaxel as compared to patients with the TT genotype. Other genetic and clinical factors may also influence risk of toxicity with paclitaxel.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

- Clinical Annotations

· **Class 3** **rs776746** *CC*
Patients with the CC genotype may have decreased but not absent risk of neurotoxicity when treated with paclitaxel as compared to patients with the TT genotype. Other genetic and clinical factors may also influence risk of toxicity with paclitaxel.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

· **Class 3** **rs776746** *CC*
Patients with the CC genotype may have decreased but not absent risk of neurotoxicity when treated with paclitaxel as compared to patients with the TT genotype. Other genetic and clinical factors may also influence risk of toxicity with paclitaxel.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*
Genotype GG may be associated with increased disease control rate and increased overall survival rate when treated with paclitaxel in Asians with metastatic breast cancer as compared to genotype AG. However, contradictory findings have been reported and no association have been reported for Caucasians. Other genetic and clinical factors may influence the response to paclitaxel.
· **Class 3** **rs1045642** *GG*
Patients with the GG genotype may have decreased risk of Neutropenia and Neurotoxicity Syndromes when treated with paclitaxel in cancer patients as compared to patients with genotype AA. Other genetic and clinical factors may influence the risk of adverse events to paclitaxel.

PEGINTERFERON ALFA-2A

IFNL3 interferon, lambda 3

- Dosing Guideline

IFNL3:rs12979860T/rs12979860C Strong
Phenotype (Genotype)

- Clinical Annotations

· **Class 3** **rs12979860** *CT*

Patients with genotype CT may have decreased response to daclatasvir, peginterferon alfa-2a, peginterferon alfa-2b and ribavirin in people with Hepatitis C, Chronic as compared to genotypes CC. SVR24 rates are higher in patients treated with the combination of daclatasvir and pegIFN-alfa/RBV than those receiving pegIFN-alfa/RBV alone across all IL28B genotypes (CC, CT, or TT) regardless of viral subtypes. Other genetic and clinical factors may also influence the response to daclatasvir therapy.

IFNL4 interferon, lambda 4 (gene/pseudogene)

- Clinical Annotations

· **Class 3** **rs12979860** *CT*

Patients with genotype CT may have decreased response to daclatasvir, peginterferon alfa-2a, peginterferon alfa-2b and ribavirin in people with Hepatitis C, Chronic as compared to genotypes CC. SVR24 rates are higher in patients treated with the combination of daclatasvir and pegIFN-alfa/RBV than those receiving pegIFN-alfa/RBV alone across all IL28B genotypes (CC, CT, or TT) regardless of viral subtypes. Other genetic and clinical factors may also influence the response to daclatasvir therapy.

LDLR low density lipoprotein receptor

- Clinical Annotations

· **Class 3** **rs14158** *GG*

Patients with the GG genotype who are co-infected with chronic hepatitis C, genotype 1 or 4, and HIV may have an increased likelihood of sustained virological response when treated with pegylated interferon and ribavirin as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence likelihood of sustained virological response.

PEGINTERFERON ALFA-2B

IFNL3 interferon, lambda 3

- Dosing Guideline

IFNL3:rs12979860T/rs12979860C Strong

Phenotype (Genotype)

- Clinical Annotations

· **Class 3** **rs12979860** *CT*

Patients with genotype CT may have decreased response to daclatasvir, peginterferon alfa-2a, peginterferon alfa-2b and ribavirin in people with Hepatitis C, Chronic as compared to genotypes CC. SVR24 rates are higher in patients treated with the combination of daclatasvir and pegIFN-alfa/RBV than those receiving pegIFN-alfa/RBV alone across all IL28B genotypes (CC, CT, or TT) regardless of viral subtypes. Other genetic and clinical factors may also influence the response to daclatasvir therapy.

IFNL4 interferon, lambda 4 (gene/pseudogene)

- Clinical Annotations

· **Class 3** **rs12979860** *CT*

Patients with genotype CT may have decreased response to daclatasvir, peginterferon alfa-2a, peginterferon alfa-2b and ribavirin in people with Hepatitis C, Chronic as compared to genotypes CC. SVR24 rates are higher in patients treated with the combination of daclatasvir and pegIFN-alfa/RBV than those receiving pegIFN-alfa/RBV alone across all IL28B genotypes (CC, CT, or TT) regardless of viral subtypes. Other genetic and clinical factors may also influence the response to daclatasvir therapy.

LDLR low density lipoprotein receptor

- Clinical Annotations

· **Class 3** **rs14158** *GG*

Patients with the GG genotype who are co-infected with chronic hepatitis C, genotype 1 or 4, and HIV may have an increased likelihood of sustained virological response when treated with pegylated interferon and ribavirin as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence likelihood of sustained virological response.

PHENPROCOUMON

VKORC1 vitamin K epoxide reductase complex, subunit 1

- Clinical Annotations

· **Class 2A** **rs9934438** *GA*

Patients with the AG genotype may have decreased dose of acenocoumarol or phenprocoumon as compared to patients with genotype GG. Other genetic and clinical factors may also influence the dose of acenocoumarol or phenprocoumon.

PRSS53 protease, serine, 53

- Clinical Annotations

· **Class 2A** **rs9934438** *GA*

Patients with the AG genotype may have decreased dose of acenocoumarol or phenprocoumon as compared to patients with genotype GG. Other genetic and clinical factors may also influence the dose of acenocoumarol or phenprocoumon.

PHENYTOIN

SCN1A sodium channel, voltage-gated, type I, alpha subunit

- Clinical Annotations

· **Class 2B** **rs3812718** *CT*

Patients with the CT genotype who are treated with phenytoin may require a higher dose as compared to patients with the CC genotype. Other genetic and clinical factors may also influence dose of phenytoin.

PRAVASTATIN

LDLR low density lipoprotein receptor

- Clinical Annotations -

· **Class 3** **rs1433099** *TC*
Patients with the CT genotype and vascular diseases may have a poorer response to pravastatin treatment as compared to patients with the TT genotype, or a better response as compared to patients with the CC genotype. Other genetic and clinical factors may also influence pravastatin response.

PROPOFOL

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations -

· **Class 4** **rs58597806** *GG*
Patients with the GG genotype may have decreased but not non-existent risk of adverse effects when treated with propofol as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence response to propofol.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations -

· **Class 4** **rs58597806** *GG*
Patients with the GG genotype may have decreased but not non-existent risk of adverse effects when treated with propofol as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence response to propofol.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations -

· **Class 4** **rs58597806** *GG*
Patients with the GG genotype may have decreased but not non-existent risk of adverse effects when treated with propofol as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence response to propofol.

CYP2B6 cytochrome P450, family 2, subfamily B, polypeptide 6

- Clinical Annotations -

· **Class 3** **rs3745274** *GG*
Patients under general anaesthesia with genotypes GG may need increased dose of propofol as compared to patients with genotype TT or GT. Other genetic and clinical factors may also influence the dose of propofol.

CYP2A7P1 cytochrome P450, family 2, subfamily A, polypeptide 7 pseudogene 1

- Clinical Annotations

· **Class 3** **rs3745274** *GG*
Patients under general anaesthesia with genotypes GG may need increased dose of propofol as compared to patients with genotype TT or GT. Other genetic and clinical factors may also influence the dose of propofol.

QUETIAPINE

COMT catechol-O-methyltransferase

- Clinical Annotations

· **Class 3** **rs6269** *AG*
Patients with the AG genotype and schizophrenia may have a poorer response to treatment with quetiapine as compared to patients with the GG genotype, or a better response as compared to patients with the AA genotype. Other genetic and clinical factors may also influence quetiapine response.
· **Class 3** **rs4818** *CG*
Patients with the CG genotype and schizophrenia may have a poorer response to treatment with quetiapine as compared to patients with the GG genotype, or a better response as compared to patients with the CC genotype. Other genetic and clinical factors may also influence quetiapine response.

RALOXIFENE

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

· **Class 3** **rs1042597** *CC*
Post menopausal women with the CC genotype and schizophrenia may have increased response to raloxifene compared to patients with the CG genotype. Other genetic and clinical factors may affect response to raloxifene.

RANIBIZUMAB

VEGFA vascular endothelial growth factor A

- Clinical Annotations

· **Class 3** **rs2010963** *CG*
Patients with the CG genotype and choroidal neovascularization may have a better response to anti-VEGF treatment, as compared to patients with the CC genotype. Other genetic and clinical factors may also influence response to anti-VEGF treatment.

REPAGLINIDE

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations -

- **Class 3** **rs2306283** *AG*
  While the GG genotype is associated with reduced plasma concentrations of repaglinide, no results are shown for the GA genotype.

CYP2C8 cytochrome P450, family 2, subfamily C, polypeptide 8

- Clinical Annotations -

- **Class 3** **rs10509681** *TT*
  Individuals with the TT (CYP2C8*1/*1) genotype may have decreased metabolism of repaglinide compared to patients with the CT genotype (CYP2C8*3/*1). No association was found with differences in blood glucose lowering efficacy. Please note, the study supporting this annotation was carried out in healthy volunteers. Other genetic and clinical factors may also influence metabolism of repaglinide.

RIFAMPIN

NAT2 N-acetyltransferase 2 (arylamine N-acetyltransferase)

- Clinical Annotations -

- **Class 2A** **rs1041983** *TT*
  Patients with the TT genotype and tuberculosis (TB) may have an increased risk for hepatotoxicity when treated with anti-TB drugs as compared to patients with the CC genotype. Other genetic and clinical factors may also influence risk for hepatotoxicity.
- **Class 2A** **rs1799930** *AA*
  Patients with the AA genotype and tuberculosis (TB) may have an increased risk of hepatotoxicity when treated with anti-TB drugs as compared to patients with the GG genotype. They also may have decreased clearance of isoniazid as compared to those with the AG or GG genotype. Other genetic and clinical factors may also influence risk for hepatotoxicity and clearance of isoniazid.
- **Class 3** **rs1799931** *GG*
  Patients with the GG genotype and tuberculosis (TB) may have a decreased risk of hepatotoxicity when treated with anti-TB drugs as compared to patients with the AA or AG genotype. However, some studies find no association with hepatotoxicity. Other genetic and clinical factors may also influence risk of hepatotoxicity.

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations -

- **Class 3** **rs11045819** *CC*
  Patients with the CC genotype may have decreased clearance of rifampin as compared to patients with the AC genotype. Other genetic and clinical factors may also influence rifampin clearance.

- **Class 3** **rs2306283** *AG*
  Patients with the AG genotype may have increased clearance of rifampin as compared to patients with the GG genotype. Other genetic and clinical factors may also influence rifampin clearance.

RISPERIDONE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype and schizophrenia may have a shorter QTc interval when treated with risperidone as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence QTc interval in patients taking risperidone.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

- **Class 3** **rs35599367** *GG*
  Patients with the GG genotype and psychiatric disorders may have increased clearance of risperidone compared to patients with the AG genotype. Other clinical and genetic factors likely affect risperidone pharmacokinetics.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

- **Class 3** **rs35599367** *GG*
  Patients with the GG genotype and psychiatric disorders may have increased clearance of risperidone compared to patients with the AG genotype. Other clinical and genetic factors likely affect risperidone pharmacokinetics.

RITONAVIR

UGT1A UDP glucuronosyltransferase 1 family, polypeptide A complex locus

- Clinical Annotations

- **Class 3** **rs10929303** *TC*
  Patients with the CT genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the TT genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.
- **Class 3** **rs1042640** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to patients with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in people with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs8330** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the TT genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to patients with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in people with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs8330** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

UGT1A3 UDP glucuronosyltransferase 1 family, polypeptide A3

- Clinical Annotations

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the TT genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to patients with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in people with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs8330** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the TT genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to patients with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in people with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs8330** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

UGT1A5 UDP glucuronosyltransferase 1 family, polypeptide A5

- Clinical Annotations

- **Class 3** **rs10929303** *TC*

Patients with the CT genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the TT genotype and an increased risk of nephrolithiasis as compared to people with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in patients with HIV who are taking atazanavir and ritonavir.

- **Class 3** **rs1042640** *GC*

Patients with the CG genotype and HIV may have a decreased risk of nephrolithiasis when treated with atazanavir and ritonavir as compared to patients with the GG genotype and an increased risk of nephrolithiasis as compared to patients with the CC genotype. Other genetic and clinical factors may also affect risk of nephrolithiasis in people with HIV who are taking atazanavir and ritonavir.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype and HIV may have an increased risk of virological failure when receiving highly active antiretroviral therapy (HAART), as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of virological failure on HAART.

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype and HIV may have increased concentrations of atazanavir as compared to patients with the AA genotypes, although this is contradicted in one study. There is no evidence that the GG genotype is associated with hyperbilirubinemia, drug discontinuation, or nephrolithiasis. Other clinical and genetic factors may also influence the concentrations of atazanavir in patients with HIV.

ROSIGLITAZONE

CYP2C8 cytochrome P450, family 2, subfamily C, polypeptide 8

- Clinical Annotations

· **Class 2A** **rs10509681** *TT*

Patients with the TT (CYP2C8*1/*1) genotype may have decreased metabolism of rosiglitazone, a larger change in HbA1c, and an increased risk of edema as compared to patients with the CC (CYP2C8*3/*3) or CT (CYP2C8*3/*1) genotype. One study found no association with blood glucose levels. Other genetic and clinical factors may also influence metabolism of rosiglitazone, risk of edema and blood glucose levels.

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

· **Class 3** **rs4149056** *TT*

Patients with the TT genotype may have decreased response to rosiglitazone in people with type II Diabetes Mellitus as compared to patients with genotype CC or CT. Other genetic and clinical factors may also influence the response to rosiglitazone.

SILDENAFIL

VEGFA vascular endothelial growth factor A

- Clinical Annotations

· **Class 3** **rs699947** *AC*

Patients with the AC genotype may have decreased response to sildenafil in men with Erectile Dysfunction as compared to patients with genotype CC. Other genetic and clinical factors may also influence the response to sildenafil.

SIMVASTATIN

HMGCR 3-hydroxy-3-methylglutaryl-CoA reductase

- Clinical Annotations

· **Class 4** **rs3846662** *GG*

The GG genotype may be associated with decreased induction of full-length transcripts and increased expression of spliced HMGCRv1 transcript as compared to AA genotype.

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations

· **Class 3** **rs717620** *CT*

Patients with the CT genotype may have decreased dose of simvastatin and atorvastatin as compared to patients with genotype CC. Other genetic and clinical factors may also influence the dose of simvastatin.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1128503** *GG*

Patients with the GG genotype and hypercholesterolemia may lesser reduction in LDL and total cholesterol when treated with simvastatin as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence cholesterol levels.

· **Class 3** **rs1128503** *GG*

Patients with the GG genotype and hypercholesterolemia may have an increased risk for myalgia when treated with simvastatin as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk for myalgia.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

· **Class 3** **rs2740574** *TT*

Patients with the TT genotype may be more likely to require a decrease in dose or switch to a different drug when treated with atorvastatin or simvastatin as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence dose of simvastatin or atorvastatin, or likelihood of switching to a different drug.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

· **Class 3** **rs2740574** *TT*

Patients with the TT genotype may be more likely to require a decrease in dose or switch to a different drug when treated with atorvastatin or simvastatin as compared to patients with the CC or CT genotype. Other genetic and clinical factors may also influence dose of simvastatin or atorvastatin, or likelihood of switching to a different drug.

SORAFENIB

VEGFA vascular endothelial growth factor A

- Clinical Annotations

· **Class 3** **rs2010963** *CG*
Patients with the CG genotype may have increased risk of hand-foot syndrome when treated with sorafenib in people with Carcinoma, Renal Cell as compared to patients with genotype CC. Other genetic and clinical factors may also influence the toxicity to sorafenib.
· **Class 3** **rs1570360** *AG*
Patients with the AG genotype may have unfavorable progression-free survival when treated with sorafenib in people with Carcinoma, Renal Cell as compared to patients with genotype GG. Other genetic and clinical factors may also influence the response to sorafenib.
· **Class 3** **rs2010963** *CG*
Patients with the CG genotype may have increased progression-free survival and increased overall survival when treated with sorafenib in people with Hepatocellular Carcinoma as compared to patients with genotype GG. Other genetic and clinical factors may also influence the response to sorafenib.

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

· **Class 3** **rs4149056** *TT*
Patients with the TT genotype may have increased likelihood of developing Thrombocytopenia when treated with sorafenib as compared to patients with genotype CC. Other genetic and clinical factors may also influence the response to sorafenib.
· **Class 3** **rs2306283** *AG*
Patients with the AG genotype may have decreased likelihood of developing Diarrhea when treated with sorafenib as compared to patients with genotype AA. Other genetic and clinical factors may also influence the response to sorafenib.

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations

· **Class 3** **rs717620** *CT*
Patients with the CT genotype may have decreased risk of skin rash when treated with sorafenib in people with Carcinoma, Renal Cell as compared to patients with genotype CC. Other genetic and clinical factors may also influence the toxicity to sorafenib.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*
Patients with the GG genotype may have decreased risk of hypertension when treated with sorafenib in people with Carcinoma, Renal Cell as compared to patients with genotype AA or AG. Other genetic and clinical factors may also influence the toxicity to sorafenib.

SULFONAMIDES, UREA DERIVATIVES

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

- Clinical Annotations

- **Class 3** **rs1057910** *AC*
  Results from patients with the AC genotype were not statistically significant.

SUNITINIB

VEGFA vascular endothelial growth factor A

- Clinical Annotations

- **Class 3** **rs699947** *AC*
  Patients with the AC genotype may have higher increase in systolic blood pressure and increased risk of developing grade 3 hypertension when treated with sunitinib as compared to patients with genotype CC. Other genetic and clinical factors may also influence the response to sunitinib.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype and renal cell carcinoma may have an increased risk for adverse effects when treated with sunitinib as compared to patients with the AA or AG genotype. One study found no association between this SNP and thrombocytopenia, neutropenia, anemia or hand-food syndrome. Other genetic and clinical factors may also influence risk for sunitinib toxicities.
- **Class 3** **rs2032582** *CC*
  Patients with renal cell carcinoma and the CC genotypes may have an increased risk of neutropenia when treated with sunitinib as compared to patients with any of the following genotypes: AA, AC, AT . Other clinical and genetic factors may also influence risk of neutropenia in patients with renal cell carcinoma who are treated with sunitinib.
- **Class 3** **rs1128503** *GG*
  Patients with renal cell carcinoma and the GG genotype who are treated with sunitinib may have an increased risk of neutropenia, leukopenia, and diarrhea as compared to patients with the AA genotypes, although this has been contradicted by some studies. Other clinical and genetic factors may also influence risk of toxicity in patients with renal cell carcinoma who are administered sunitinib.
- **Class 3** **rs2032582** *CC*
  Patients with renal cell carcinoma and the CC genotype may have an incresed response to sunitinib as compared to patients with the AA genotypes. There is no association between this SNP and overall or progression free survival. Response here refers to stable disease or partial response and non-response to progressive disease. Other clinical and genetic factors may also influence response to sunitinib in patients with renal cell carcinoma.

TACROLIMUS

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype who are undergoing organ transplantation may have increased clearance and dose requirements of tacrolimus, as compared to patients with the AA or AG genotype. However, the vast majority of studies find no association between this SNP and clearance or dose of tacrolimus. Other genetic and clinical factors, such as CYP3A5*3, may also influence clearance and dose of tacrolimus.
- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype who are CYP2C19 extensive metabolizers and are receiving tacrolimus after renal transplantation may have increased plasma concentrations of (R)-lansoprazole but no significant differences in the frequency of gastroesophageal symptoms as compared to patients with the AA genotype. Other genetic and clinical factors may also influence lansoprazole clearance.
- **Class 3** **rs1045642** *GG*
  Pediatric patients with the GG genotype who are treated with prednisone and tacrolimus may have an increased risk of remaining on steroids 1 year after heart transplantation compared to patients with the AA or AG genotype. Other genetic and clinical factors may also influence risk of remaining on steroids 1 year after transplantation.
- **Class 3** **rs1045642** *GG*
  Patients who receive a kidney with the GG genotype may have increased estimated glomerular filtration rate (eGFR) when treated with tacrolimus as compared to patients with the AA or AG genotype. No significant results were seen when recipient genotype was considered. Other genetic and clinical factors may also influence eGFR.
- **Class 3** **rs2032582** *CC*
  Patients with CC genotype may have lower success rate in achieving short-term remission when treated with tacrolimus in people with Colitis, Ulcerative as compared to patients with the AA genotype. The majority of studies find no association with dose of tacrolimus in people with transplantations as compared and genotypes of this SNP. Other genetic or clinical factors may influence response and dose of tacrolimus.
- **Class 3** **rs1128503** *GG*
  Patients with the GG genotype who are undergoing organ transplantation may have decreased concentrations of tacrolimus as compared to patients with the AA or AG genotype. However, the majority of the literature evidence shows no association between this variant and tacrolimus concentrations, clearance or dose. Other genetic and clinical factors may also influence concentrations of tacrolimus.
- **Class 3** **rs2032582** *CC*
  Patients with the CC genotype who are undergoing organ transplantation may have increased metabolism and dose requirements of tacrolimus, as compared to patients with the AA, AC, CT or TT genotypes. However, the majority of studies have found no association between this polymorphism and metabolism or dose of tacrolimus. Other genetic and clinical factors, such as CYP3A5*3, may also influence metabolism and dose of tacrolimus.
- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype and ulcerative colitis may have a poorer chance at achieving remission when treated with tacrolimus as compared to patients with the AA genotype. Other genetic and clinical factors may also influence likelihood of ulcerative colitis remission.
- **Class 3** **rs1045642** *GG*
  Patients with the GG genotype who are undergoing kidney transplantation and are treated with tacrolimus may have decreased risk of experiencing transplant rejection as compared to patients with the AG genotype. However, the majority of studies find no association between this polymorphism and risk for transplant rejection. Other genetic and clinical factors may also influence risk of transplant rejection.

- **Class 3** **rs1045642** *GG*

Patients with the GG genotype who are undergoing kidney transplantation may have a decreased risk of hypokalemia when treated with tacrolimus as compared to patients with the AG genotype. Other genetic and clinical factors may also influence risk of hypokalemia.

CYP3A5 cytochrome P450, family 3, subfamily A, polypeptide 5

Dosing Guideline

CYP3A5:*1A/*1A Strong

Increase starting dose 1.5 to 2 times recommended starting dose. Total starting dose should not exceed 0.3mg/kg/day. Use therapeutic drug monitoring to guide dose adjustments.

- Clinical Annotations

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing liver transplantation may have an increased risk for renal dysfunction when treated with tacrolimus as compared to patients with the CT or TT genotype (*1/*3 or *1/*1). Other genetic and clinical factors may also influence risk for renal dysfunction.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing organ transplantation may have a decreased risk for neurotoxicity when treated with tacrolimus as compared to patients with the CT (*1/*3) genotype. Other genetic and clinical factors may also influence risk for neurotoxicity in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing kidney transplantation may have decreased systolic and diastolic blood pressure when treated with tacrolimus as compared to patients with the CT or TT (*1/*3 or *1/*1) genotype. However, the majority of studies show no association between the CC genotype and blood pressure. Other genetic and clinical factors may also influence changes in blood pressure in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing organ transplantation may have a decreased risk for infections when treated with tacrolimus as compared to patients with the CT or TT (*1/*3 or *1/*1) genotype. Other genetic and clinical factors may also influence risk for infections in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) and ulcerative colitis may have an increased chance of achieving remission when treated with tacrolimus as compared to patients with the CT (*1/*3) genotype. Other genetic and clinical factors may also influence chance of remission from ulcerative colitis.

ZSCAN25 zinc finger and SCAN domain containing 25

- Clinical Annotations

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing liver transplantation may have an increased risk for renal dysfunction when treated with tacrolimus as compared to patients with the CT

or TT genotype (*1/*3 or *1/*1). Other genetic and clinical factors may also influence risk for renal dysfunction.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing organ transplantation may have a decreased risk for neurotoxicity when treated with tacrolimus as compared to patients with the CT (*1/*3) genotype. Other genetic and clinical factors may also influence risk for neurotoxicity in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing kidney transplantation may have decreased systolic and diastolic blood pressure when treated with tacrolimus as compared to patients with the CT or TT (*1/*3 or *1/*1) genotype. However, the majority of studies show no association between the CC genotype and blood pressure. Other genetic and clinical factors may also influence changes in blood pressure in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing organ transplantation may have a decreased risk for infections when treated with tacrolimus as compared to patients with the CT or TT (*1/*3 or *1/*1) genotype. Other genetic and clinical factors may also influence risk for infections in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) and ulcerative colitis may have an increased chance of achieving remission when treated with tacrolimus as compared to patients with the CT (*1/*3) genotype. Other genetic and clinical factors may also influence chance of remission from ulcerative colitis.

CYP3A cytochrome P450, family 3, subfamily A

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing liver transplantation may have an increased risk for renal dysfunction when treated with tacrolimus as compared to patients with the CT or TT genotype (*1/*3 or *1/*1). Other genetic and clinical factors may also influence risk for renal dysfunction.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing organ transplantation may have a decreased risk for neurotoxicity when treated with tacrolimus as compared to patients with the CT (*1/*3) genotype. Other genetic and clinical factors may also influence risk for neurotoxicity in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing kidney transplantation may have decreased systolic and diastolic blood pressure when treated with tacrolimus as compared to patients with the CT or TT (*1/*3 or *1/*1) genotype. However, the majority of studies show no association between the CC genotype and blood pressure. Other genetic and clinical factors may also influence changes in blood pressure in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) undergoing organ transplantation may have a decreased risk for infections when treated with tacrolimus as compared to patients with the CT or TT (*1/*3 or *1/*1) genotype. Other genetic and clinical factors may also influence risk for infections in patients receiving tacrolimus.

- **Class 3** **rs776746** *CC*

Patients with the CC genotype (CYP3A5 *3/*3) and ulcerative colitis may have an increased chance of achieving remission when treated with tacrolimus as compared to patients with the CT (*1/*3) genotype. Other genetic and clinical factors may also influence chance of remission from ulcerative colitis.

- **Class 3** **rs35599367** *GG*

Transplant recipients with the GG genotype (also known as CYP3A4 *1/*1) may have increased metabolism of tacrolimus, resulting in decreased exposure and a higher dose requirement (among other pharmacokinetic parameters), as compared to patients with the AG or AA genotype (CYP3A4 *22/*1 and *22/*22). Around half of studies report an association, and half report no association. One study found an association with liver transplant donor genotype but not recipient genotype. Other genetic and clinical factors, such as CYP3A5 *3 (rs776746), may also influence metabolism of tacrolimus.

- **Class 4** **rs4986910** *AA*

Patients with the AA genotype who are undergoing kidney transplantation may require an increased dose of tacrolimus as compared to patients with the GG genotype. Other genetic and clinical factors, such as CYP3A5*3, may also influence dose of tacrolimus.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

———————————————- Clinical Annotations ———————————————

- **Class 3** **rs28371759** *AA*

Patients with the AA genotype (CYP3A4 *1/*1) who underwent kidney transplantation may have decreased metabolism of tacrolimus as compared to patients with the AG genotype (*1/*18B). Other genetic and clinical factors, such as rs776746 (CYP3A5*3), may also influence metabolism of tacrolimus.

- **Class 3** **rs35599367** *GG*

Transplant recipients with the GG genotype (also known as CYP3A4 *1/*1) may have increased metabolism of tacrolimus, resulting in decreased exposure and a higher dose requirement (among other pharmacokinetic parameters), as compared to patients with the AG or AA genotype (CYP3A4 *22/*1 and *22/*22). Around half of studies report an association, and half report no association. One study found an association with liver transplant donor genotype but not recipient genotype. Other genetic and clinical factors, such as CYP3A5 *3 (rs776746), may also influence metabolism of tacrolimus.

- **Class 4** **rs4986910** *AA*

Patients with the AA genotype who are undergoing kidney transplantation may require an increased dose of tacrolimus as compared to patients with the GG genotype. Other genetic and clinical factors, such as CYP3A5*3, may also influence dose of tacrolimus.

TAMOXIFEN

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

———————————————- Clinical Annotations ———————————————

- **Class 3** **rs1045642** *GG*

Women with the GG genotype and breast cancer may have a decreased chance of disease recurrence when treated with tamoxifen as compared to patients with the AG genotype. Other genetic and clinical factors may also influence breast cancer recurrence.

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

· **Class 3** **rs2740574** *TT*

Patients with the TT genotype and breast cancer may have a decreased risk of developing endometrial cancer following tamoxifen treatment as compared to patients with the CT genotype. Other genetic and clinical factors may also influence risk of endometrial cancer.

CYP3A cytochrome P450, family 3, subfamily A

- Clinical Annotations

· **Class 3** **rs2740574** *TT*

Patients with the TT genotype and breast cancer may have a decreased risk of developing endometrial cancer following tamoxifen treatment as compared to patients with the CT genotype. Other genetic and clinical factors may also influence risk of endometrial cancer.

ABCC2 ATP-binding cassette, sub-family C (CFTR/MRP), member 2

- Clinical Annotations

· **Class 4** **rs717620** *CT*

Patients with the CT genotype and breast neoplasms may have increased disease-free survival when treated with tamoxifen as compared to patients with the CC genotype. Other genetic and clinical factors may also influence disease-free survival with tamoxifen treatment.

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

· **Class 3** **rs2011425** *TT*

Patients with the TT genotype and breast cancer may have decreased concentrations of tamoxifen-n-glucuronide when taking tamoxifen compared to patients with the GG and GT genotypes. Other clinical and genetic factors may affect the metabolism of tamoxifen.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

· **Class 3** **rs2011425** *TT*

Patients with the TT genotype and breast cancer may have decreased concentrations of tamoxifen-n-glucuronide when taking tamoxifen compared to patients with the GG and GT genotypes. Other clinical and genetic factors may affect the metabolism of tamoxifen.

UGT1A5 UDP glucuronosyltransferase 1 family, polypeptide A5

- Clinical Annotations

· **Class 3** **rs2011425** *TT*

Patients with the TT genotype and breast cancer may have decreased concentrations of tamoxifen-n-glucuronide when taking tamoxifen compared to patients with the GG and GT genotypes. Other clinical and genetic factors may affect the metabolism of tamoxifen.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

- Clinical Annotations

· **Class 3** **rs2011425** *TT*

Patients with the TT genotype and breast cancer may have decreased concentrations of tamoxifen-n-glucuronide when taking tamoxifen compared to patients with the GG and GT genotypes. Other clinical and genetic factors may affect the metabolism of tamoxifen.

UGT1A7 UDP glucuronosyltransferase 1 family, polypeptide A7

- Clinical Annotations

· **Class 3** **rs2011425** *TT*

Patients with the TT genotype and breast cancer may have decreased concentrations of tamoxifen-n-glucuronide when taking tamoxifen compared to patients with the GG and GT genotypes. Other clinical and genetic factors may affect the metabolism of tamoxifen.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

· **Class 3** **rs2011425** *TT*

Patients with the TT genotype and breast cancer may have decreased concentrations of tamoxifen-n-glucuronide when taking tamoxifen compared to patients with the GG and GT genotypes. Other clinical and genetic factors may affect the metabolism of tamoxifen.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations

· **Class 3** **rs2011425** *TT*

Patients with the TT genotype and breast cancer may have decreased concentrations of tamoxifen-n-glucuronide when taking tamoxifen compared to patients with the GG and GT genotypes. Other clinical and genetic factors may affect the metabolism of tamoxifen.

TEGAFUR

DPYD dihydropyrimidine dehydrogenase

- Dosing Guideline

DPYD:*1/*1 Moderate

Use label-recommended dosage and administration.

——————————————- Clinical Annotations ——————————————

· **Class 1A** **rs55886062** *AA*

Patients with the AA genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have a decreased, but not absent, risk for drug toxicity as compared to patients with the AC or CC genotype (DPYD *1/*13 or *13/*13). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

· **Class 1A** **rs3918290** *CC*

Patients with the CC genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of fluoropyrimidine drugs and 2) decreased, but not non-existent, risk for drug toxicity as compared to patients with the CT or TT genotype (DPYD *1/*2A or *2A/*2A). Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine based chemotherapy.

· **Class 1A** **rs67376798** *TT*

Patients with the TT genotype and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) increased clearance of the drug and 2) decreased, but not absent, risk and reduced severity of drug toxicity as compared to patients with the AT genotype. Fluoropyrimidines are often used in combination chemotherapy such as FOLFOX (fluorouracil, leucovorin and oxaliplatin), FOLFIRI (fluorouracil, leucovorin and irinotecan) or FEC (fluorouracil, epirubicin and cyclophosphamide) or with other drugs such as bevacizumab, cetuximab, raltitrexed. The combination and delivery of the drug may influence risk for toxicity. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

· **Class 3** **rs1801159** *TT*

Patients with the TT genotype (DPYD *1/*1) and cancer who are treated with fluoropyrimidine-based chemotherapy may have 1) a decreased likelihood of nausea, vomiting, and leukopenia, 2) increased response and 3) increased clearance of fluorouracil as compared to patients with the CT or CC genotype (DPYD *1/*5 or *5/*5). However, other studies find no associations or contradictory associations with fluoropyrimidine-induced drug toxicity or response. Other genetic and clinical factors may also influence response to fluoropyrimidine-based chemotherapy.

CYP2A6 cytochrome P450, family 2, subfamily A, polypeptide 6

——————————————- Clinical Annotations ——————————————

· **Class 4** **rs28399433** *AA*

Hepatic cells with the AA genotype may have increased expression of the CYP2A6 gene, resulting in increased metabolism of tegafur, as compared to those with the AC or CC genotype. Other genetic and clinical factors may also influence CYP2A6 expression and tegafur metabolism.

THALIDOMIDE

CYP4B1 cytochrome P450, family 4, subfamily B, polypeptide 1

- Clinical Annotations

· **Class 3** **rs4646487** *CC*

Patients with the CC genotype may have a decreased but not absent risk of toxicity with docetaxel and thalidomide as compared to patients with the CT or TT genotypes. Other genetic and clinical factors may also influence treatment response.

NAT2 N-acetyltransferase 2 (arylamine N-acetyltransferase)

- Clinical Annotations

· **Class 3** **rs1799931** *GG*

Patients with the GG genotype may have an increased risk of toxicity with docetaxel and thalidomide as compared to patients with the AA genotype. Other genetic and clinical factors may also influence treatment response.

TICAGRELOR

CYP3A4 cytochrome P450, family 3, subfamily A, polypeptide 4

- Clinical Annotations

· **Class 3** **rs56324128** *CC*

Patients with the CC genotype and acute coronary syndrome may have decreased concentrations of ticagrelor compared to patients with the CT genotype. Other factors may affect concentrations of ticagrelor.

SLCO1B1 solute carrier organic anion transporter family, member 1B1

- Clinical Annotations

· **Class 3** **rs4149056** *TT*

Patients with the TT genotype and acute coronary syndrome may have decreased concentrations of ticagrelor compared to patients with the CC and CT genotypes. Other factors may affect concentrations of ticagrelor.

TOLBUTAMIDE

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

- Clinical Annotations

· **Class 4** **rs9332239** *CC*

Patients with the CC genotype may have increased metabolism of tolbutamide as compared to patients with the CT or TT genotypes. Other genetic and clinical factors may also influence tolbutamide metabolism.

TRAMADOL

SLC22A1 solute carrier family 22 (organic cation transporter), member 1

- Clinical Annotations

- **Class 3** **rs12208357** *CC*
  Patients with the CC genotype may have lower plasma concentrations of O-desmethyltramadol when exposed to tramadol in healthy individuals as compared to patients with the TT genotype. Other genetic or clinical factors may influence the response to tramadol.
- **Class 3** **rs34130495** *GG*
  Patients with the GG genotype may have decreased plasma concentrations of O-desmethyltramadol when exposed to tramadol in healthy individuals as compared to patients with the AA or AG genotype. Other genetic or clinical factors may also influence the clearance of tramadol.

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

- **Class 3** **rs2032582** *CC*
  Patients with the CC genotype and bone fractures may be less likely to respond to tramadol treatment as compared to patients with the AA genotype. Other genetic and clinical factors may also influence response to tramadol.

VALPROIC ACID

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

- Clinical Annotations

- **Class 3** **rs2070959** *AG*
  Patients with the AG genotype may require an increased dose of valproic acid compared to patients with the AA genotype. Other genetic and clinical factors may also influence a patients dose requirements.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

- Clinical Annotations

- **Class 3** **rs2070959** *AG*
  Patients with the AG genotype may require an increased dose of valproic acid compared to patients with the AA genotype. Other genetic and clinical factors may also influence a patients dose requirements.

UGT1A7 UDP glucuronosyltransferase 1 family, polypeptide A7

- Clinical Annotations

- **Class 3** **rs2070959** *AG*

Patients with the AG genotype may require an increased dose of valproic acid compared to patients with the AA genotype. Other genetic and clinical factors may also influence a patients dose requirements.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

· **Class 3** **rs2070959** *AG*

Patients with the AG genotype may require an increased dose of valproic acid compared to patients with the AA genotype. Other genetic and clinical factors may also influence a patients dose requirements.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations

· **Class 3** **rs2070959** *AG*

Patients with the AG genotype may require an increased dose of valproic acid compared to patients with the AA genotype. Other genetic and clinical factors may also influence a patients dose requirements.

VENLAFAXINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*

Patients with genotype GG and depressive disorder may have increased response to venlafaxine compared to patients with genotype AA or AG. Patients with GG genotype and narcolepsy were not found to have different response to venlafaxine compared to patients with other genotypes. Other clinical and genetic factors also may affect response to venlafaxine.

CYP2D6 cytochrome P450, family 2, subfamily D, polypeptide 6

- Clinical Annotations

· **Class 4** **rs367543000** *GG*

Patients with the GG genotype were not studied.

VERAPAMIL

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs2032582** *CC*

Patients with the CC genotype may have decreased metabolism of verapamil as compared to patients with the AA or AC genotype. Other genetic and clinical factors may also impact the metabolism of verapamil.

- **Class 3** **rs1045642** *GG*

  Patients with the GG genotype may have decreased metabolism of verapamil as compared to patients with the AA or AG genotype. Other genetic and clinical factors may also impact the metabolism of verapamil.

VITAMIN E

CYP4F2 cytochrome P450, family 4, subfamily F, polypeptide 2

Clinical Annotations

- **Class 3** **rs2108622** *CC*

  Patients with the CC genotype may have decreased steady-state levels of vitamin E when taking vitamin E supplements as compared to patients with the CT and TT genotypes. Other clinical and genetic factors may also influence steady-state levels of vitamin E in patients taking vitamin E supplements.
- **Class 4** **rs3093105** *AA*

  The AA genotype may be associated with decreased CYP4F2 activity and decreased vitamin e metabolism as compared to the AC or CC genotype. This is based solely on an in vitro study in a haploid heterologous cell system. Other clinical and genetic factors may also influence metabolism of vitamin e.

WARFARIN

CYP2C9 cytochrome P450, family 2, subfamily C, polypeptide 9

Dosing Guideline

CYP2C9:*3/*1 N/A

Estimate the anticipated stable dose of warfarin using the algorithms available on http://www.warfarindosing.org, the IWPC Pharmacogenetic Dosing Algorithm or the FDA-approved drug label

Clinical Annotations

- **Class 1A** **rs1057910** *AC*

  Patients with the AC genotype: 1) may require a decreased dose of warfarin as compared to patients with the AA genotype 2) may have an increased risk for adverse events as compared to patients with the AA genotype.
- **Class 2A** **rs7900194** *GG*

  Patients with the GG genotype who are treated with warfarin may require a higher maintenance dose as compared to patients with the AG or GG genotype. Other clinical or genetic factors may also influence warfarin dose.
- **Class 2A** **rs56165452** *TT*

  Patients with the TT genotype may required higher dose of warfarin as compared to patients with the CT or CC genotype. Other clinical or genetic factors may also influence warfarin dose. This variant rs56165452 defines CYP2C9*4.

VKORC1 vitamin K epoxide reductase complex, subunit 1

Dosing Guideline

CYP2C9:*3/*1 N/A

Estimate the anticipated stable dose of warfarin using the algorithms available on http://www.warfarindosing.org, the IWPC Pharmacogenetic Dosing Algorithm or the FDA-approved drug label

Clinical Annotations

- **Class 1B** **rs9934438** *GA*

Patients with the AG genotype who are treated with warfarin may require a lower dose as compared to patients with the GG genotype, and a higher dose as compared to patients with the AA genotype. Other clinical and genetic factors may also influence a patients required dose of warfarin.

- **Class 2A** **rs9923231** *CT*

Patients with genotype CT may require shorter time to therapeutic INR when treated with warfarin as compared with patients with genotype CC. Other genetic and clinical factors may also influence the response to warfarin.

- **Class 2A** **rs9923231** *CT*

Patients with the CT genotype may have increased risk of over-anticoagulation when treated with warfarin as compared with patients with genotype CC. Other genetic and clinical factors may also influence the toxicity to warfarin.

- **Class 2B** **rs7196161** *GA*

Patients with the AG genotype may require an increased dose of warfarin as compared to patients with the GG genotype and a decreased dose of warfarin as compared to patients with the AA genotype. Other clinical and genetic factors may also influence the dose of warfarin.

- **Class 3** **rs17880887** *GG*

Patients with the GG genotype may require lower dose of warfarin as compared to patients with the GT or TT genotype. Other genetic and clinical factors may also influence warfarin dose. This variant rs17880887 is part of VKORC1 H8 and H9 haplotypes.

- **Class 3** **rs9923231** *CT*

Patients with the CT genotype may spent less time in INR therapeutic range (TTR) when treated with warfarin as compared with patients with genotype CC. Contradictory findings have also been reported. Other genetic and clinical factors may also influence the response to warfarin.

- **Class 3** **rs9934438** *GA*

Patients with the AG genotype may have decreased time in therapeutic range of INR (TTR) when treated with warfarin as compared to genotype GG. Other genetic and clinical factors may also influence the response to warfarin.

PRSS53 protease, serine, 53

Clinical Annotations

- **Class 1B** **rs9934438** *GA*

Patients with the AG genotype who are treated with warfarin may require a lower dose as compared to patients with the GG genotype, and a higher dose as compared to patients with the AA genotype. Other clinical and genetic factors may also influence a patients required dose of warfarin.

- **Class 2A** **rs9923231** *CT*

Patients with genotype CT may require shorter time to therapeutic INR when treated with warfarin as compared with patients with genotype CC. Other genetic and clinical factors may also influence the response to warfarin.

- **Class 2A** **rs9923231** *CT*

Patients with the CT genotype may have increased risk of over-anticoagulation when treated with warfarin as compared with patients with genotype CC. Other genetic and clinical factors may also influence the toxicity to warfarin.

- **Class 3** **rs9923231** *CT*

Patients with the CT genotype may spent less time in INR therapeutic range (TTR) when treated with warfarin as compared with patients with genotype CC. Contradictory findings have also been reported. Other genetic and clinical factors may also influence the response to warfarin.

- **Class 3** **rs9934438** *GA*

Patients with the AG genotype may have decreased time in therapeutic range of INR (TTR) when treated with warfarin as compared to genotype GG. Other genetic and clinical factors may also influence the response to warfarin.

BCKDK branched chain ketoacid dehydrogenase kinase

——————————————- Clinical Annotations ——————————————

- **Class 2A** **rs9923231** *CT*

Patients with genotype CT may require shorter time to therapeutic INR when treated with warfarin as compared with patients with genotype CC. Other genetic and clinical factors may also influence the response to warfarin.

- **Class 2A** **rs9923231** *CT*

Patients with the CT genotype may have increased risk of over-anticoagulation when treated with warfarin as compared with patients with genotype CC. Other genetic and clinical factors may also influence the toxicity to warfarin.

- **Class 3** **rs9923231** *CT*

Patients with the CT genotype may spent less time in INR therapeutic range (TTR) when treated with warfarin as compared with patients with genotype CC. Contradictory findings have also been reported. Other genetic and clinical factors may also influence the response to warfarin.

CYP4F2 cytochrome P450, family 4, subfamily F, polypeptide 2

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs2108622** *CC*

Patients with the CC genotype may have increased international normalized ratio variability (INR-var) when treated with warfarin as compared to patients with genotype TT or CT in European-Americans after the warfarin dose-titration phase. Other genetic and clinical factors may also influence the response to warfarin.

UGT1A10 UDP glucuronosyltransferase 1 family, polypeptide A10

——————————————- Clinical Annotations ——————————————

- **Class 3** **rs887829** *CT*

Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A3 UDP glucuronosyltransferase 1 family, polypeptide A3

- Clinical Annotations

- **Class 3** **rs887829** *CT*
  Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A4 UDP glucuronosyltransferase 1 family, polypeptide A4

- Clinical Annotations

- **Class 3** **rs887829** *CT*
  Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A5 UDP glucuronosyltransferase 1 family, polypeptide A5

- Clinical Annotations

- **Class 3** **rs887829** *CT*
  Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A6 UDP glucuronosyltransferase 1 family, polypeptide A6

- Clinical Annotations

- **Class 3** **rs887829** *CT*
  Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A7 UDP glucuronosyltransferase 1 family, polypeptide A7

- Clinical Annotations

- **Class 3** **rs887829** *CT*
  Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A8 UDP glucuronosyltransferase 1 family, polypeptide A8

- Clinical Annotations

- **Class 3** **rs887829** *CT*

Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A9 UDP glucuronosyltransferase 1 family, polypeptide A9

- Clinical Annotations

· **Class 3** **rs887829** *CT*

Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

UGT1A1 UDP glucuronosyltransferase 1 family, polypeptide A1

- Clinical Annotations

· **Class 3** **rs887829** *CT*

Patients with the CT genotype and heart valve replacement may require a larger stable dose of warfarin compared to patients with the CC genotypes. Other clinical and genetic factors affect stable dose of warfarin.

ZIDOVUDINE

ABCB1 ATP-binding cassette, sub-family B (MDR/TAP), member 1

- Clinical Annotations

· **Class 3** **rs1045642** *GG*

Patients with the GG genotype and HIV may have an increased risk of virological failure when receiving highly active antiretroviral therapy (HAART), as compared to patients with the AA genotype. Other genetic and clinical factors may also influence risk of virological failure on HAART.
